THE writer has just completed a tour of the United States for the purpose, among other things, of learning what he could of the farm-loan needs of the United States. These journeyings have covered some twenty thousand miles of travel, and the expenditure of some fifty-three solid days of hearings, at which men of all occupations—farmers, agricultural students, county agents, professors of the extension departments of agricultural colleges, landlords, tenants, landowners, real-estate agents, bankers, loan agents, abstracters of title, rural workers along sociological lines, officers of life-insurance companies, editors of farm papers—men and women of all walks of life that relate to our farms and farming, have testified as to agricultural conditions. These hearings have been held in forty-four of the forty-eight states of this Union, and have pretty well covered the farming conditions in all of them. Any mind that takes to such an experience some little knowledge of the matters dealt with cannot fail to receive from it a good deal of enlightenment.

One thing stands out in bold relief as a high light in the picture of the complex series of problems that must be solved if farming is to be properly financed in this country, and the rush of competent farmer material to the cities lessened. This is the urgent need of some way for the proper financing of men of agricultural efficiency, ability and integrity who can farm well, wish to farm, and cannot get land for want of money. No such condition exists in the city. A Charles M. Schwab, a Henry Ford, an Andrew Carnegie or a J. Pierpont Morgan might serve as an illustration of the sort of men who are ever on the lookout for business efficiency, coupled with the right sort of ability and integrity in city affairs; but any business man who reads this is a better one. The crying need of city businesses is not for money, but for brains and trustworthiness.

I know of a farm hand who had never made over three hundred dollars a year in his life until he was picked up by an editor, who was attracted by his writings, as a promising fellow for the publishing business, and given a position in an editorial office at twenty dollars a week. Within three years that young man refused an editorial position at five thousand dollars a year, because he was already earning several times his initial nonagricultural wage, and had on hand work so attractive that he would not leave it, thus retiring from what he called "a fight half won." He had been a good farm hand. He loved the soil. If he could have acquired a farm and a home in the country he would never have dreamed of quitting it for the city. He would have lived in his rural neighborhood and been a powerful force for making it a good place in which to live. He would have earned far less than he now receives, and, you may say, would never have achieved so high a plane of success; but that is by no means certain.

There are broad fields of usefulness, public and private, opening to the farmer with a talent for public life and extraordinary skill in farming. But the point is that rural life had far greater need of him than did city life. Editors there are in plenty; but great farmers are few.

DECORATIONS BY GUERNSEY MOORE

The Riddle of the Sphinx

YET, after all, that is not the main point. The main point is that he ought to have been financed as a plain business proposition. He was strong, honest and efficient. If he could have been placed on a farm and given a chance to pay for it he would have done the trick. If there had been some system by which money could have been supplied to him with which to acquire land, he would have paid for the land and rendered a profitable rate of interest to the lender of the money.

His case is extraordinary with respect to the unusual ability shown by him in his city occupation. But all over the country there are young men who can succeed on the farm, but will fail in the cities, or will make only humdrum, moderate urban successes. Such are the young men who are yearly being turned out by the agricultural colleges, either as graduates or quite as good as graduates, so far as are concerned the needs of practical farming, and who cannot obtain farms, though they are filled with that enthusiasm for their chosen pursuit which fills the young graduate in law or medicine, and which makes so strongly for success. The pinfeathered lawyer or doctor may rent an office and, if he waits, is pretty sure to get some business. Very few of them, so far as can be observed by one who has been through the professional sweat, actually fail. Waiting does their business for them.

With the penniless farmer, the case is woefully otherwise. The longer he waits, the higher goes the price of land. He cannot get a farm by degrees; it must be acquired as a whole. He is in the same predicament as a young doctor, who must obtain a flourishing practice all at once or never. In other words, he is in an almost impossible position. The result is that he gives up in despair and takes a position as a teacher, or enters some business in which ability can be financed by employers.

The loss to country life of the able and ambitious farm laborers and agricultural students is only a part of the drain under which rural life is suffering. The farmer with two or three sons loses all but one of them to the city, almost as a matter of course, unless he is exceptionally well-to-do. The farmer's son who has shown by years of efficient farming that he can make good ought to be able to marry the girl of his choice and have the chance to make good as a farmer. He has grown up on the farm, and has occupied the position of a farmowner by his part in the management of his father's farm. To drop to the status of a farm hand may not be a social lowering, but it is something worse—it is a distinct descent in financial prospects. As a farm hand, he simply cannot marry and support a wife; and he is too proud to ask any girl to marry such prospects, even if any girl would be so foolish as to accept him. He drifts to the city; or he accumulates an outfit of horses, tools and equipment, and rents a farm.

And this brings us to the largest class of farmers possessing farming ability and integrity—the skillful farm tenant. All over the United States the best men speak of the increase of farm tenantry as a sort of national Riddle of the Sphinx, not to answer which is for the nation to be destroyed. Landlordism has come upon the United States in a form worse than the landlordism of Europe, even before the last remnant of the public domain has been reduced to private ownership—that wonderful domain out of which it was once vauntingly sung that "Uncle Sam is rich enough to give us all a farm."

Wherever land is rich and valuable it is passing into the hands of renters under a system of tenantry that amounts to a conspiracy to rob, first, the soil; next, the tenant, who has no abiding place save from year to year; and finally, the landlord, who finds his farms getting poorer.

These tenants are, many of them, as good farmers as America possesses. Surveys show that in the Corn Belt the tenants make larger labor incomes on the average than do the owners of lands who operate them for themselves. The tenants do not receive so large incomes as the owners, for the accepted method of reckoning farm-labor incomes allows five per cent interest on the land value and capital value before wages are reckoned; but in strict labor income the tenants, on the average, make more out of the lands than do the owning operators—this owing to the excessive value of the land. They could not do this if they were shiftless ne'er-do-wells, as they are often unjustly described. They sometimes labor so effectively that by skinning the land they are able to buy it. Not one in ten, however, who should in some way be financed for that purpose, is able to buy land.

Everybody gains when the tenant becomes a farm-owner under circumstances that enable him to pay out. He gains by becoming a fixture in the neighborhood. His family gains in standing and self-respect, and in the opportunity of finding permanence in the neighborhood society, in school and in church. School and church and Grange and Society of Equity and Farmers' Union, and all coöperative effort, gain by this new accession to their ranks of a real farmer and his family.

How the Farm Hand is Helped

THE landlord gains in the long run by having a fixed security substituted for waning fertility and deteriorating buildings. The land gains by passing into the hands of a man interested in its upkeep and improvement, instead of in the mining of the soil for this year's profit. The nation gains in the character of its citizenship. Nothing is more remarkable than the testimony of prominent Southerners as to the desirability of making landowners of the negroes.

"Give a negro a farm of his own," they say, "and he becomes a good citizen at once. From the moment that he becomes a landowner he ceases to be a dangerous man. If we could make every decent negro a landowner one of our greatest problems would be nearing solution."

The reason for this is plain. The transformation in the negro is more evident, perhaps, than in the white man; but the same thing takes place in both. What takes place is the steadying and uplifting effect of having a stake in the land.

The United States Government has undertaken, through the Federal Farm Loan Bureau, to finance the long-time needs of the farmer. The Federal Farm Loan Act, when fully in operation, will make it possible for any farmer complying with its provisions, anywhere in the United States, at any time, to borrow any sum, from one hundred dollars to ten thousand, for any term of years from five to forty, at reasonable rates of interest, up to half the value of his land plus one-fifth of the value of the permanent insured improvements upon it.

This is the greatest job of loaning on real estate ever undertaken in the history of the world. But it has frequently been asked:

"How will this benefit the farm hand who may be a perfectly safe business risk but hasn't the money to pay his way to within reach of a loan? How will it help the tenant farmer who has equipment but not enough cash to make a first payment on the farm? How will it help the ambitious young man with farming skill and education, either of the classroom laboratory sort or of the fields, to get a farm when he is provided with nothing but the essentials of success—given land—but lacks what, after all, should be less important, money?

"The Federal Government is organizing twelve great land banks to cover in their operations the whole of the continental United States—exclusive of Alaska—to loan money to whom? To people who can put up two dollars or more of security for every dollar advanced! Isn't this a sort of Barmecide feast for the farm hand, the young farmer without land or money, and the tenant who is ready for a farm and can't buy it? When was there a time when any man had any difficulty in buying a farm if he had half its value in cash? Isn't this another exemplification of the text: 'Whosoever hath, to him shall be given'? How are integrity, ability and efficiency in farming to be financed under this new law—unless they possess two hundred per cent in collateral? And do you call loaning

Digitized by Google

on two hundred per cent security helping the under dog? *It looks* a good deal like the old bad deal!"

This is nowhere near so true as it sounds. There are farmers in astounding numbers all over the country who own their lands and are yet very poor. They possess lands that will yield splendid returns for money invested in their *more* adequate financing, but are outside the scope of the old loaning system. Farm loans as now made exert a strong pressure in favor of the large farm and against the small one.

In the Corn Belt, and elsewhere in regions of high land values, money-loaners discriminate, for perfectly proper reasons, in favor of the loan of five thousand dollars or more; and the farmer who wants to borrow on farm mortgage a sum less than this is not much better off than as if he lived in the high-interest zone. In some of the best farming regions of the country, where money to loan on farm mortgage is supposed to be plentiful at five or six per cent, the man who wants a long-time loan of a thousand dollars or less does not know where to get it, though the large farmer may be courted by the loan agents with offers of funds.

In other parts, like New England, the financial institutions have had their attention directed to the West and the cities so long that farm loans all about them are neglected. The president of a Connecticut insurance company stated at one of our hearings that, though his concern had something like a hundred million dollars loaned on farm mortgage—I do not remember the exact sum—not one dollar was loaned on a Connecticut farm. And yet there is no better land than some in Connecticut, and there is no state in which money for farm development could be more profitably or safely used in very considerable volume. The eyes of the mortgagee have been turned away from New England, and similarly from many other regions. One New England farmer stated that in his county the average farmer would not have the nerve to ask a farm loan of a bank or trust company—or of anyone, in fact, except the village capitalist.

Good Land That Needs Financing

IN STATES possessing a "spotty" soil—that is, a soil which varies widely with locality—it has not paid the loan companies to work out an organization for safe loaning; and so these regions, larger in extent and quite as great in national importance as the broad stretches of lands which are so uniform that a man might land in the night from a parachute and pay for the farm on which he alighted with perfect assurance that he could not be much deceived in the land values, are not financed at all, in any systematic way, as to their farm loans. These farmers are without money on farm mortgage, even though they own their farms. In other regions—immense regions—the business of furnishing abstracts of title has not been developed; and the loan company must either send a skilled man at great expense to make a "search," or rely on the opinion of the village lawyer. It does not pay to make loans, especially small loans, under such conditions. In other places the boundaries of the farms must be established by surveys.

Widely spread over the United States are lands the values of which are low, though constantly rising, and the loans required are small. Loan companies cannot profitably handle their needs. It costs money to make a farm loan; and it costs no more to make one of five thousand dollars or more on land covered by an abstract of title made by a bonded abstracter than to loan two hundred and fifty dollars on a bit of a farm described by metes and bounds—"from a spring at the foot of Dead Man's Hill; thence in a northerly direction, twenty degrees east, to a sycamore; thence due west, to a stone," and so on.

This matter of boundaries is one in which east is east and west is west, and never the twain shall meet. A Western lawyer bought a tract of land in the Appalachians. He took the muniments of title and struggled with them for a day to discover—if such a thing might be—whether the land conveyed was of the area and description of the tract sold him. He was used to abstracts referring to quarters, sections, townships and ranges, under the rectangular system devised by the United States Land Office many years ago, under which the wayfaring man, though a fool, may drive to the exact spot mentioned in any deed from any county seat in the West. These old metes and bounds were a Chinese puzzle to him; so he sent the papers to a legal friend in the East.

"Please look these over," he wrote, "and see whether I am buying any land in any particular locality or not. I am accustomed to a different mode of description, and where the lines are described as running from a hole in the ground, thence in an upperly direction to a state of mind, it puts me up in the air!"

And all these things—small loans, queer descriptions, boundaries rendered uncertain by the death of the sycamore, the drying up of the spring since George Washington ran the line, or the removal of the stone, sharply varying values from farm to farm and from hillside to hillside, lack of legal ability or bonded abstract companies—all these put the loan companies up in the air, too, and place on the farm-loan black list millions of acres of farms the values of which are just as stable and loans on which are just as safe as are those of Grundy County, Iowa—and, as Mr. Peggotty might say, "I can't say no fairer nor that." But all these problems the Federal Farm Loan Bureau must, as a matter of legal duty, work out. Wherever loans may safely be made, the work of making them must be systematized and perfected by a Federal Bureau.

It seems quite within the bounds of possibility that within a few years this work will develop not hundreds of millions but perhaps thousands of millions of choice farm loans, which the present system does not reach at all; and will also add new empires to the areas open to lenders outside the Federal System. And all the farmers so reached, and a multitude of others, are quite as needy as the moneyless farm laborer or the tenant who lacks the wherewithal to pay fifty per cent of the purchase price of a farm.

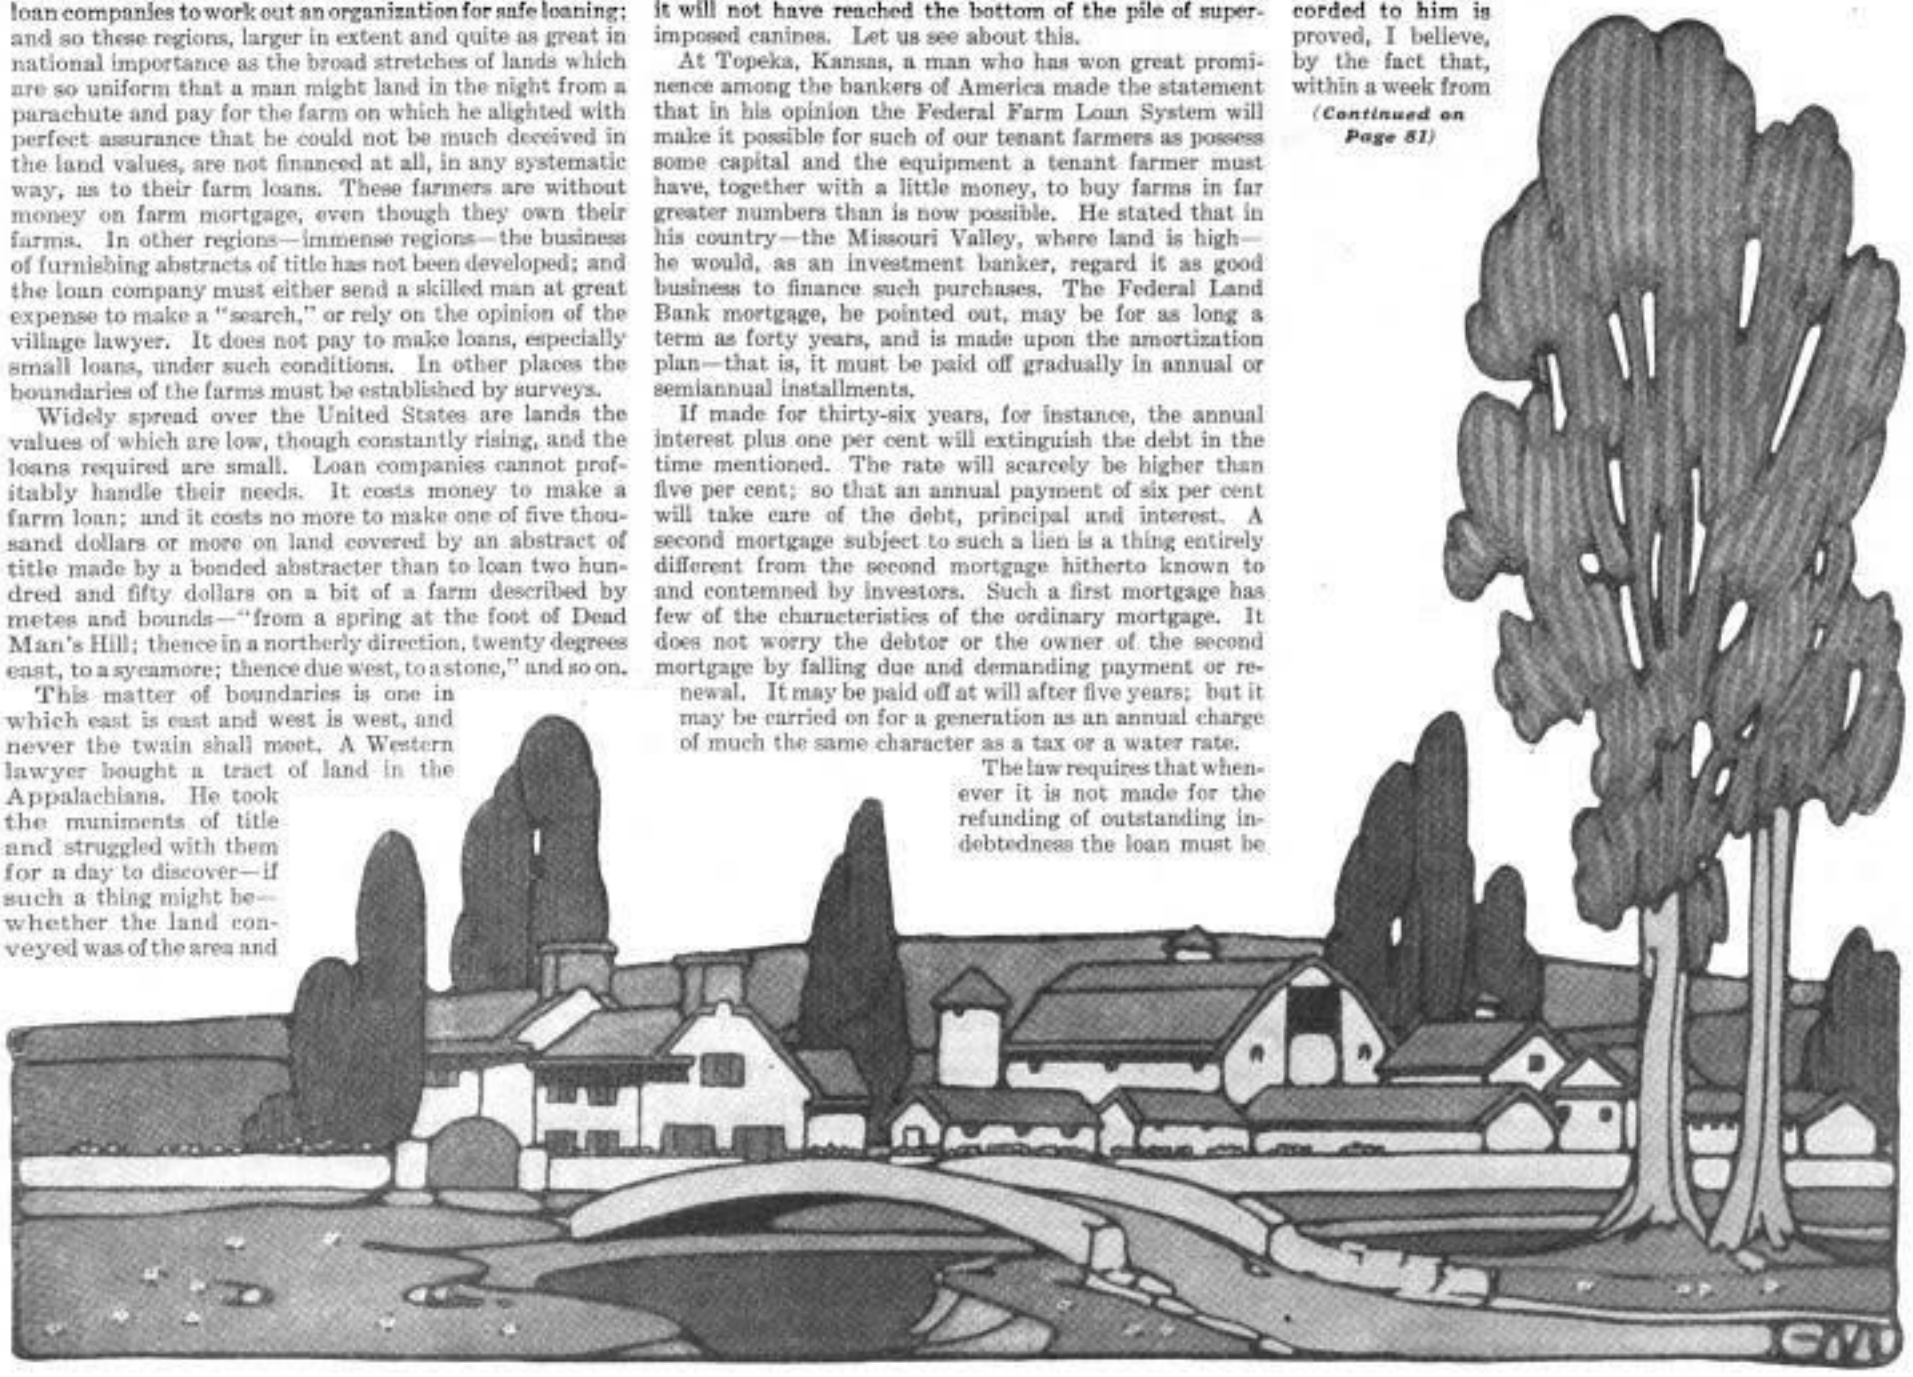
The new system is not one that gives solely to him who hath. It operates also in the interest of him who hath not. But if it leaves the laborer, the young man starting out in life and the tenant farmer altogether without help, it will not have reached the bottom of the pile of superimposed canines. Let us see about this.

At Topeka, Kansas, a man who has won great prominence among the bankers of America made the statement that in his opinion the Federal Farm Loan System will make it possible for such of our tenant farmers as possess some capital and the equipment a tenant farmer must have, together with a little money, to buy farms in far greater numbers than is now possible. He stated that in his country—the Missouri Valley, where land is high—he would, as an investment banker, regard it as good business to finance such purchases. The Federal Land Bank mortgage, he pointed out, may be for as long a term as forty years, and is made upon the amortization plan—that is, it must be paid off gradually in annual or semiannual installments.

If made for thirty-six years, for instance, the annual interest plus one per cent will extinguish the debt in the time mentioned. The rate will scarcely be higher than five per cent; so that an annual payment of six per cent will take care of the debt, principal and interest. A second mortgage subject to such a lien is a thing entirely different from the second mortgage hitherto known to and contemned by investors. Such a first mortgage has few of the characteristics of the ordinary mortgage. It does not worry the debtor or the owner of the second mortgage by falling due and demanding payment or renewal. It may be paid off at will after five years; but it may be carried on for a generation as an annual charge of much the same character as a tax or a water rate.

The law requires that whenever it is not made for the refunding of outstanding indebtedness the loan must be for the improvement of the farm—for livestock, fertilization, draining, leveeing, for buildings like silos, barns or better houses, fencing, clearing or otherwise reclaiming; so that the security of the Federal Land Bank loan is in most cases increased by the expenditure of the money loaned, and the second mortgage is made better. Moreover, the tenant who becomes an owner begins to build and improve. The farm gets better, instead of running down.

The annual amortization slowly reduces the first lien, while the farm grows better. Round it grow up the loves and traditions that bind the owner to his home. If he is a good man it will take an agricultural convulsion of Nature to eject him from that farm—provided, as our banker friend cannily stated, the annual charges against him are not too high. He figured out for us what he meant by this—and in doing so he made a computation of the greatest importance to the tenant farmers, the landlords and the whole people of the United States.



Sound Second Mortgages

"SUPPOSE," said he, "that a tenant farmer, a good man, comes to me and says that he has the equipment to farm eighty acres of land, and can raise, from funds saved or by making a sale, fifteen hundred dollars. He can buy the eighty acres for eight thousand dollars. He can join the nearest National Farm Loan Association and borrow from the Federal Land Bank half the value of the farm—four thousand dollars—and turn this sum over to the seller of the land. This leaves the sum of two thousand five hundred dollars to be provided for.

"I should figure that if the interest on the first mortgage—the amortization charge, the interest, taxes, insurance and upkeep—did not amount to more than a fair rental for the land it would be a safe loan for an investment banker. I should not think so if the first mortgage had only three, five or ten years to run; because I should figure that it would take him about ten years to pay off my second mortgage. I think seven per cent would be a fair interest for the second mortgage to bear and that it would be good paper to handle."

That this gentleman from whom I quote from memory has won the prominence among the bankers of America that I have accorded to him is proved, I believe, by the fact that, within a week from

CAPPY RICKS, WHEAT BARON

Wherein J. Augustus Redell Scores a Knock-Out

By PETER B. KYNE

ILLUSTRATED BY F. R. GRUGER

"Friend of My Heart, I Love You! Damn Eet! I Say Eet!"

SEÑOR FELIPE LUIZ ALMEIDA, secretary-treasurer of the West Coast Trading Company and familiarly known as Live Wire Luiz, gazed a moment in dumb popeyed admiration at his partner, J. Augustus Redell. The latter watched him suspiciously, for he knew from experience what was coming. He was not disappointed.

"Friend of my heart!" the little Peruvian cried excitedly, and held out his arms to Redell, inviting a fraternal embrace. "I love you! Damn eet! I say eet! You are one wezard weeth the money-making schemes!"

Mr. Redell cautiously compromised on a hearty handshake; to avoid a kiss he was careful to keep the table between himself and Live Wire Luiz.

"Shall we empty the corporate sock and climb aboard for every cent we can beg, borrow or steal?" he demanded.

"Sure, I bet you!" Live Wire Luiz cried; for, though a featherweight physically, he was possessed of the courage of an Alexander.

J. Augustus Redell put on his hat, took from a pigeonhole in his desk the last trial balance of the West Coast Trading Company's books and departed for a conference with his banker. Half an hour later he returned, and the expectant Luiz promptly noted a cloud on Mr. Redell's sunny countenance.

"I can't arrange for a loan," he reported disgustedly. "The limit, in view of our present obligations, has been reached."

"On margin of ten cents," suggested Live Wire Luiz, "take a chance, *amigo*. Thees is not speculation. It ees what you call the ceench weeth the copper reevets."

"I figure it that way; nevertheless, copper-riveted cinches sometimes aren't properly cinched and Fortune backs out of the packsaddle. I dare not take a long chance on this, Luiz.

"If something went wrong we'd be sadly embarrassed. We dare not take a chance up to the limit of what money we have on hand, because we need those funds for other things."

Live Wire Luiz swore mournfully in Spanish. Redell nodded and retired to his own office, where for an hour he sat with his head in his hands, searching his agile brain for a bright idea that would lead him out of his dilemma. Suddenly he leaped to his feet, tossed his hat to the ceiling, and caught it again as it came down.

"Cappy Ricks is my meat," he declared aloud. "Besides, I owe Cappy one for making a monkey out of me on that lath deal. He hoisted me on my own petard—whatever a petard may be. Now I'll hoist him, and incidentally annex a profit for the West Coast Trading Company."

He rushed out into California Street and for the major portion of the day was very busy among various shipping offices. When he returned, late in the afternoon, to the offices of the West Coast Trading Company, his alert young face wore a pleased and confident smile. Live Wire Luiz noted this and took heart of hope.

II

CAPPY RICKS, president emeritus of the Ricks Lumber & Logging Company and the Blue Star Navigation Company, was, for the thousandth time since his voluntary retirement from active business some ten years previously, overwhelmed with his ancient responsibilities. Mr. Skinner, his general manager, in charge of the lumber end of Cappy's vast interests, had, under the insistent prodding of his wife, consented grudgingly to a vacation and had gone up into the Sierras to loaf and fish.

Scarcely had Skinner departed when one of the Blue Star steamers ran ashore on the Southern California coast, and Captain Matt Peasley, Cappy's son-in-law and right bower, in charge of the shipping end, left immediately for the scene of the disaster to superintend the work of floating the stranded vessel. This left Cappy riding herd on the destinies of the Blue Star ships, with Mr. Hankins, Skinner's understudy, looking after the lumber.

Prior to boarding the train, Matt Peasley had ventured the suggestion that Mr. Skinner be ordered by wire to return to town at once; but this veiled hint that the Blue Star ships could not be managed by the man who had built up the Blue Star Navigation Company had been received very coldly by the president emeritus of the Ricks interests.

"Young feller," Cappy informed his son-in-law testily, "I'll have you know I was managing the Blue Star Navigation Company quite some years before you quit wearing pinafores; so I guess, while you and Skinner are away from the office, we can manage to stagger along after a fashion."

"But I don't like to have you worried with business after you've retired ——"

"Retired!" Cappy hooted. "Swell chance I've got to retire! I'll die in the harness whether I want to or not. Tut, tut, my boy! Don't be afraid to put me in as a pinch hitter for this organization. The worst I can do is to single—and I might clout a home run."

"But Skinner has been away two weeks ——"

"Enough! It would be a bad thing to obsess Skinner with the notion that we can't get along without him. Then he never would take a rest; and I don't want any martyrs or neurasthenics round my office. You got anything on the fire that's liable to burn or boil over before you get back?"

"Nothing to worry about, Cappy," Matt answered. "Our five-masted schooner Mindoro is the only vessel requiring immediate attention. She arrived at Sydney yesterday with lumber from Grays Harbor, and as yet I haven't been able to get a satisfactory return cargo for her."

"What have you been holding out for?"

"I want to get a cargo for delivery in San Francisco if possible. The vessel will be ready to go on dry dock by the time she gets back here; and besides, I'm planning to put a semi-Diesel-type engine in her."

"Not by a jugful! She wasn't built with a shaft log, and I won't have you weakening my Mindoro by cutting away her deadwood ——"

"Tish! Tush! You're a back number, Cappy. They don't cut through the deadwood any more. They run the shaft over her quarter and hang it on struts."

"She'll carry a helm ——"

"She'll not; but if she does, let her. It'll give the helmsman something to do."

Cappy subsided, fearful that if he persisted he might be given new evidence of the fact that times had changed a trifle, here and there, since he had ostensibly gone on the retired list.

"Well, I'll take care of the Mindoro," he assured his son-in-law. "Early in life I adopted the woodpecker as my patron saint. Ever since, whenever I want anything I keep pecking away, and pretty soon I bust through somewhere."

The following morning, bursting with a sense of responsibility, Cappy came bustling down to the office and got on the job at eight-thirty. After looking through the mail he called up all the freight brokers in town and urged them to make a special effort to line up a San Francisco cargo for the Mindoro; then he summoned Mr. Skinner's stenographer and was busy dictating when Mr. J. Augustus Redell was announced by a youth from the general office. Cappy went to the door to welcome his beloved young friend and business enemy.

"Come in, Gus, my dear boy," he chirped, "and rest your face and hands." He turned to the stenographer. "That will be all, my dear, for the present. I can't dictate business secrets in the presence of this—ahem!—harumph-h-h!—er ——"

His desk telephone rang. Cappy took down the receiver and grunted.

"J. O. Heyfuss & Co. are calling you, Mr. Ricks," his private exchange operator announced.

Cappy smiled and nodded. J. O. Heyfuss & Co. were ship, freight and marine insurance brokers.

"Something doing for my Mindoro," he soliloquized aloud.

"Mr. Ricks?" a voice came over the wire.

"Hello there!" Cappy replied at the top of his voice. For some reason he always shouted when telephoning. "Ricks on the job! Whatja got for my Mindoro, Heyfuss? . . . Zinc ore? Never carried any before. Don't know what it looks like. . . . Yes; that freight rate is acceptable. We should have more, but God forbid that we should be considered human hogs. . . . Yes. . . . Sure it's for discharge in San Francisco? . . . All right. Close for it. . . . Good-by! . . . Hey there, Heyfuss! Don't close in a hurry. See if you can't get the charterers to pay the towage over to her loading port. If they won't pay all, strike 'em for half."

He hung up without saying good-by.

"Well, that's out of the way," he declared with satisfaction. "Just closed for a cargo of zinc ore from Australia to San Francisco ex our schooner Mindoro. Matt Peasley's been hunting wild-eyed for a cargo for her—scouring the market, Gus—and nothing doing! And here the old master comes along and digs up a cargo while you'd be saying Jack Robinson. By the Holy Pink-Toed Prophet, if you can show me how the rising generation is going to get by ——"

"My Dear Boy, Suppose You and I Go Out and Pin One On? Hey?"

Digitized by Google

He paused suddenly, leaned forward, and pointed an accusing finger at his visitor.

"Gus," he charged, "you're up to something. I can see it in your eyes. You look guilty."

Mr. Redell hitched his chair close to Cappy and with his index finger tapped the old gentleman three times on the right knee—three impressive taps.

"Alden P. Ricks," he began with equal impressiveness, "I have a scheme ——"

Cappy chuckled and slapped his thin old thigh.

"I knew it! By the Holy Pink-Toed Prophet! Gus, if you ever come into my office and fail to pull a scheme on me I'll think you aren't enjoying your usual robust health. What are you going to start now? A skunk farm for cornering the market on Russian sable?"

"Cut out the hilarity. This is serious business, Cappy. I can show you where you and I can waltz into the Chicago Pit, make a killing on December wheat, and escape with a sizable wad before our identity is discovered."

Cappy, caught off his guard, blinked at the enormity of the prospect; but, remembering his dignity as a business man, he shook his head sadly and replied:

"Wheat! Wheat, eh? A lumber and shipping man monkeying with wheat? Not for little old Alden P. Ricks! No, sir! When I go speculating I stick to my specialties—lumber and ships. Did you ever hear of a gambler, winning a fortune at faro, who didn't drop his winnings on the ponies?"

"But this is a beautiful layout."

"I don't know anything about wheat and I'm too old to learn. Besides, I don't trust you, Gus. You're an infernal scoundrel; and experience has taught me that any time I take your tip and go in on a deal I have to step lively to keep from being walked on."

"But this time I'm free from guile. I won't stab you, Cappy."

"No use! The last boat just left, Augustus."

Mr. Redell, however, was made of rather stern stuff. He was a young man who never took "No" for an answer. Persistence was his most striking characteristic.

"Now listen," he implored. "Let the dead past bury itself. I give you my word of honor, Cappy, that this deal is on the level. Just let me put all my cards on the table while you take a look; then, if you don't want to come in, all I ask is your word of honor that you'll stay out while I round up a partner with red blood in his veins."

Cappy pricked up his ears at that. He saw that Redell was serious; he knew that once the latter passed his word of honor he never broke it. Still, Cappy did not wish to appear precipitate in his surrender; so he said weakly:

"I'm against speculation."

"You mean you're against foolish speculation," Redell corrected him. "I take it, however, that you have no objection to playing a sure thing."

"Well," Cappy admitted, "in that event I might be persuaded. Nevertheless, I'm afraid of you. There's a fly in the ointment, even if I cannot see it. You owe me a poke, and you'll never rest until you've squared the account between us."

Mr. Redell held up his hands in abject distress.

"Cappy," he pleaded, "don't say that. You wrong me cruelly. It is in my power to stand idly by and let you assimilate a poke right now; but, just to show you I haven't any hard feelings, I'll do something nice for you instead."

"What do you mean—nice?"

"I'll save you money—not only to-day but for years to come; and I'll save your self-respect."

"Shoot!"

"Call up J. O. Heyfuss & Co. and tell them to take their cargo of zinc ore in bulk for your schooner Mindoro and go to the devil with it!"

"But, good gracious, boy, I have to get something for her homeward trip!"

"In this case nothing is better than something. Do you know anything about zinc ore?"

"Yes; as much as an Eskimo knows about the doctrine of transubstantiation."

"I thought so. Well, I'll enlighten you. Zinc ore is blamed near as heavy as lead, and it's as fine as cement. Load it in a ship in bulk and, what with the pitching and rolling of the vessel on a long voyage, she opens up every seam and crack in her interior; then this powdered ore sifts into the skin of the ship and down into her bilge, and you'll never be able to get it out without tearing the ship apart. Why, after a vessel has freighted a cargo of zinc ore there may be as much as fifty tons left in her after she's supposed to be discharged; and, of course, thereafter she'll carry that much less cargo than she did before. Besides, the consignees are liable to send you a bill for the shortage; you can gamble your head they'll deduct it from the freight bill."

"Holy sailor!" Cappy was appalled.

"Why," Redell continued, "I'm surprised at your ignorance, Cappy!"

"And I'm amazed at your intelligence! Where did you get all this zinc-ore dope?" Cappy challenged. "How do I know it's true?"

"I got it from Captain Matt Peasley. I heard him give it to J. O. Heyfuss on the floor of the Merchants' Exchange two weeks ago, when Heyfuss tried to sneak up on his blind side and hang that cargo of zinc ore on him. I guess they weren't importing much zinc ore when you were active in business, Cappy, or you'd be hep without being told. You see the plot, don't you? As soon as Heyfuss learned that Matt Peasley and Skinner had gone away, leaving a defenseless old man on the job, he organized himself to spear you."

"The shameless son of a sea cook! By gravy, Gus, you're my friend!"

"Need any more proof?"

"Not a speck."

"Then I'll give you some. Call up Heyfuss and declare that ore cargo off; after you've done that I'll tell you where you can get something better. Moreover, you can close the deal yourself and save the brokerage."

Cappy Ricks called up J. O. Heyfuss and in a few terse sentences told that individual where to head in.

"Now, then ——" he began, facing round on Redell once more.

Again Mr. Redell's index finger tapped Cappy's knee. Dramatically he pronounced a single word:

"Wheat!"

"Wheat?"

"Wheat!"

"What kind of wheat?" In his amazement Cappy was rather helpless.

"Number One white Australian wheat."

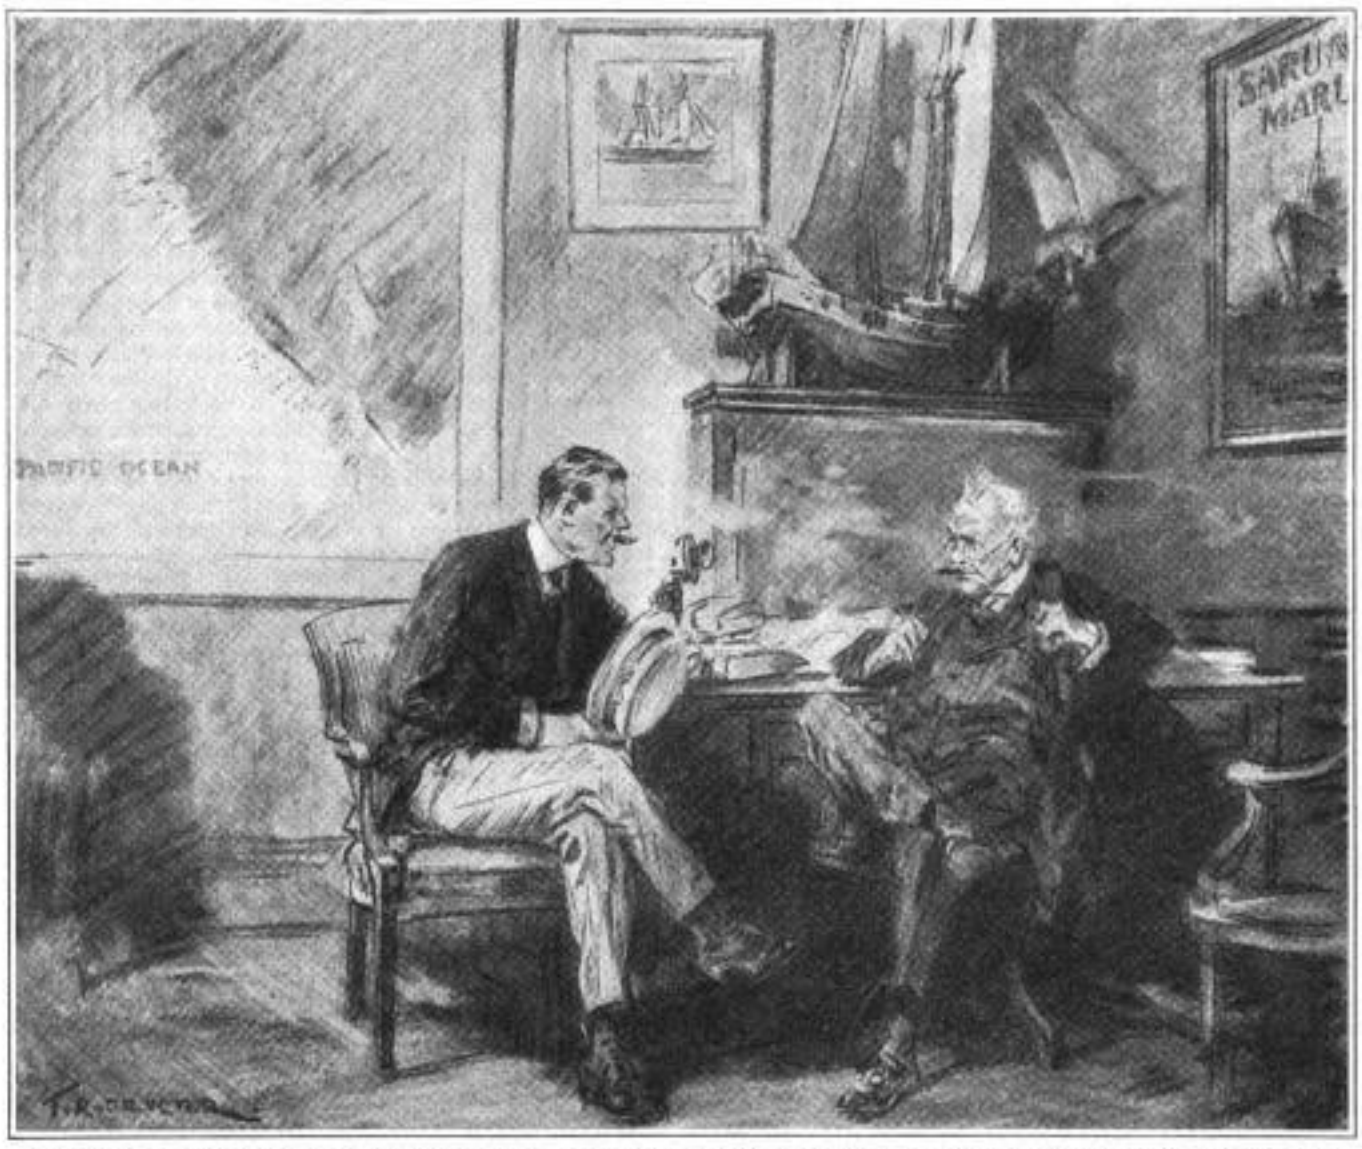
"You jibbering jackdaw! Wheat? Don't you know blamed well that wheat is one of the commodities Australia never exports to these United States? Why? Because we don't need her dog-goned wheat! We grow all the wheat we need and a lot more we don't need; we export that, and it's just as fine wheat as you'll find anywhere. Moreover, any time our crop is a failure, our next-door neighbor, Canada, is Johnny-on-the-spot, ready to make prompt delivery. So what in thunder are you talking about?"

For answer J. Augustus Redell drew from his pocket that morning's paper and pointed to the headline of a front-page story. Cappy adjusted his spectacles and read: Bakers Announce Six-Cent Loaf!

"Hum-m-m!" said Cappy.

"You bet! And it's a smaller loaf, by the way. Doesn't that argue that there is something doing in wheat, when the price of bread goes to six cents for a half portion?"

"Well, there might be something in that, Gus. Crack along and tell me some more."



"Until the identity of the real culprits is fixed, Cappy, we must blame the war in Europe for the six-cent loaf; likewise for the fifteen-dollar shoe that formerly cost our wives six or seven; for the eleven pounds of sugar for a dollar, when twenty to twenty-two pounds was the standard in the good old days. Europe is too busy fighting to pay much attention to farming; the wheat farmers of Canada are somewhere in France, instead of being at home tending to business; and it has been up to Uncle Sam and the Argentine Republic to feed the world, you might say. Naturally speculators have seized upon this condition to shoot the price of wheat to the skies, and in desperation the millers have been casting about to buy cheaper wheat. Investigation discloses the fact that Australia has an enormous quantity of wheat on hand; some of it is the surplus of the 1915 crop. Of course she has exported all she could to England; but, at that, she has been handicapped."

"How?"

"Because when a ship sails from Liverpool with goods for Australia, it is a rare case when that same ship promptly loads with Australian goods and puts back to Liverpool. She takes a cargo of coal, say, from Newcastle up to Manila; a general cargo from Manila to Seattle or San Francisco; thence to a West Coast port with a general cargo; thence to New York with nitrate; thence to Europe with foodstuffs or munitions. Australia hasn't had the tonnage to export her wheat and it's been piling up on her. Now they've simply got to sell something to get some ready money."

"This is perfectly re-markable!"

Redell took a document from his pocket and gravely handed it to Cappy, who examined it and discovered the same to be a charter party, consummated the day before between the West Coast Trading Company, owners of the barkentine Mazeppa, and Messrs. Ford & Carter, a well-known export and import firm whose principal business

"I Don't Know Anything About Wheat and I'm Too Old to Learn. Besides, I Don't Trust You, Gus. You're an Infernal Scoundrel"

Digitized by Google

was done in grain. Cappy read the charter party carefully and even verified the signatures, with all of which he was familiar. The vessel was to carry a cargo of wheat from Melbourne to San Francisco at a freight rate of —— shillings.

"Re-markable!" Cappy declared. "Pre-posterous!"

"Seeing is believing. Call up Ford & Carter, and they'll jump over themselves to give you a cargo of wheat for your Mindoro."

"Im-possible!"

"Well, I'm telling you. Why, it stands to reason, Cappy! Canada and the United States are so much nearer Europe than is Australia it has been cheaper to use our wheat, and the result is we've been cleaned out; and the newspapers are filled with dismal stories of the sufferings of the poor due to the increased price of bread."

"Come to think of it, Gus, there has been a lot of that stuff in the papers lately. But, of course, when a fellow's stomach is full and he isn't in danger of being attached for debt, he never thinks of the less fortunate brother. Yes, Gus, I dare say the demand for our wheat now exceeds the visible supply."

"Is it any wonder, then, that this condition of affairs should come to the attention of the Australian exporters? Just because Australian wheat has never been shipped into the United States is no reason why it shouldn't be shipped—particularly when the price of flour goes up daily. Why, we pay two and a half for the fifty-pound sack of flour that formerly cost us a dollar and a quarter! Eggs are up to seventy cents a dozen—by jingo, Cappy, what's going to become of us?"

"God knows!" Cappy answered dismally.

Redell had him hypnotized. Already Cappy could see the gates of the poorhouse opening to receive them all. Redell's voice brought him back to a realization of his peril.

"You'll find, Cappy Ricks, that for months to come every sailing vessel that carries lumber to Australia from the Pacific Coast will come back with a cargo of wheat while these war prices are maintained."

"Great Jumping Jehoshaphat! How'd you get next to all this, Gus?"

"The early bird gets the worm, and success comes to the man who creates his own opportunities. I thought it all up out of my own head, Cappy, and then tried it out on Ford & Carter. It knocked 'em cold for a minute; but that was only because the proposition was so unusual. When I explained the situation to them, however, and gave them time to digest it, both offered to take me out to luncheon. You can see for yourself they've chartered our Mazeppa at a fancy freight rate."

Cappy licked his lips.

"The Mindoro is sound, tight and seaworthy," he murmured. "She could carry wheat."

"Come on in, Cappy. The water's fine!"

"I'll do it! Gus, you're a mighty good fellow, if I do say it that shouldn't. I have five windjammers en route to Australia this minute, and, by the Holy Pink-Toed Prophet, if I can get wheat charters for all of them on the return trip I'll accept, if it costs me money. Gus, something has got to be done about this high cost of living or we'll all go to hell together. There comes a time in a man's life when he must put aside the sordid question of 'How much is there in it for me?' and ask himself: 'How much can I put in it for the other fellow?' Gus, it's our Christian duty to furnish tonnage to import this wheat. We should, as patriotic citizens, make it our business to boom Australian wheat in the United States and give these dog-goned pirates that gamble in the foodstuffs of the country a run for their money. Food prices should be regulated by this Government. The Chicago Pit should be abolished by legislative enactment ——"

"Well, they won't do it this year, Cappy," Redell interrupted dryly. "Still, it occurred to me that I saw an opening where two high-minded philanthropists—to wit, Alden P. Ricks and J. Augustus Redell—might strike a blow for freedom and at the same time give these wheat speculators a kick where it will do them the most good. When one cannot annihilate his enemy the next best thing is to take some money away from him; and you and I, Cappy Ricks, can take a young fortune away from these fellows, while at the same time depressing the price of wheat and doing our fellow countrymen a favor. Are you prepared to volunteer under my banner? If so, hold up your right hand."

Cappy held up his right hand.

"Out with it, Gus," he ordered; "out with it! This is most interesting."

"Ah! You're interested now, are you? Well, bearing in mind the fact that your specialty is lumber and ships, I will give you an opportunity to withdraw before it is too late. Besides, it occurs to me that I have already done enough for you to-day."

"Don't be greedy, Gus. Remember there is an exception to every rule. Besides, I'm getting old and—er—ahem!—hell's bells, boy, I've got to have my fling every once in a while. Come now, Gus! Out with it! I believe your proposition embodied the coupling of both our names in the betting, did it not?"

"It did, Cappy. Still, come to think of it, I really ought not come in here and tempt you into speculating ——"

"How much money do you want?" Cappy shrilled impatiently. "Cut out this infernal drivel and get down to business. Unfold your proposition; and if it looks to me like a winner I'll take a flyer with you if it's the last act of my sinful life."

"On your own head be it, Cappy. Here goes! However, before laying my plan before you, perfect frankness compels me to state that my visit to you was not born of an overweening desire to do you a kindness or make money for you. Philanthropy is not my long suit—in business hours; and my interest in you to-day is purely a selfish one."

"Go on; go on, boy! Am I a child in arms?"

"I have made a ball, Cappy," Redell continued, "and I want you to fire it. I have a splendid prescription to make a clean-up in December wheat ——"

"Give me your prescription."

"Well, sir, my prescription lacks one small ingredient to make it a standard household remedy. You can supply that ingredient—to wit, cash of the present standard of weight and fineness. Every spare dollar that Live Wire Luiz and I can get our hands on is working overtime in the legitimate business of the West Coast Trading Company; every loose asset with a hockable value has been hocked, and we dare not strain our credit with our banker by borrowing money with which to speculate. If I apply for a sizable loan, without putting up the collateral, he'll ask me what I want to do with the money—and if I answer truthfully he'll throw Luiz and me and our account out of his bank. And I never was a very successful liar. Therefore, in consideration of the valuable information I can furnish, I suggest that you carry me for a quarter of a million bushels of December wheat."

"How much will that cost me?" Cappy queried warily.

"We'll operate on margin. I think a margin of ten cents a bushel will do the trick; of course, if wheat should go up a point you'll be asked to come through with more money. However, I have a sneaking notion that a well-known financial heavyweight like you can place his order with any of the local brokers without having to put up a single cent; at the most, they might ask you for five thousand or ten thousand dollars. But they know you're good for any engagement you may make; they'd be tickled to death to have your promissory note. I suggest that you get in touch with a sound brokerage house in this city—one that is a member of the New York Stock Exchange and the Chicago Board of Trade—and sell, for my account, two hundred and fifty thousand bushels of December wheat at the market."

"What'll I do for myself?"

"Go as far as you like. You know your own limitations. I'm desirous of selling a quarter of a million bushels at the market; and, as I am furnishing the plans and specifications for this raid, I suggest that you sell at least a quarter of a million yourself."

"Funny business!" Cappy murmured. "Selling a quarter of a million bushels of wheat you do not own and never will! Hum-m-m! Ahem! Harumph-h-h! Then what?"

He bent his head and gazed very severely at Mr. Redell over the rims of his spectacles. For reply Mr. Redell took from his pocket thirteen sheaves of paper and handed them to Cappy, who investigated and discovered them to be thirteen forty-eight-hour options on thirteen sailing vessels bound to Australian ports with lumber, and not as yet provided with a return cargo to the United States.

"By to-morrow morning I shall have exercised those options and closed for thirteen cargoes of wheat," Redell explained. "You have five vessels bound to Australia also. Give me an option on them for their return cargo and that will make eighteen."

"Yes, yes. Then what?"

"I will charter all of the eighteen to Ford & Carter, who will load them with Number One white Australian wheat for Pacific Coast ports. Before doing so, however, Ford & Carter will have closed contracts with Pacific Coast milling companies for the sale of every grain of it, in order to protect themselves against a falling market."

"Naturally. And the market is ——"

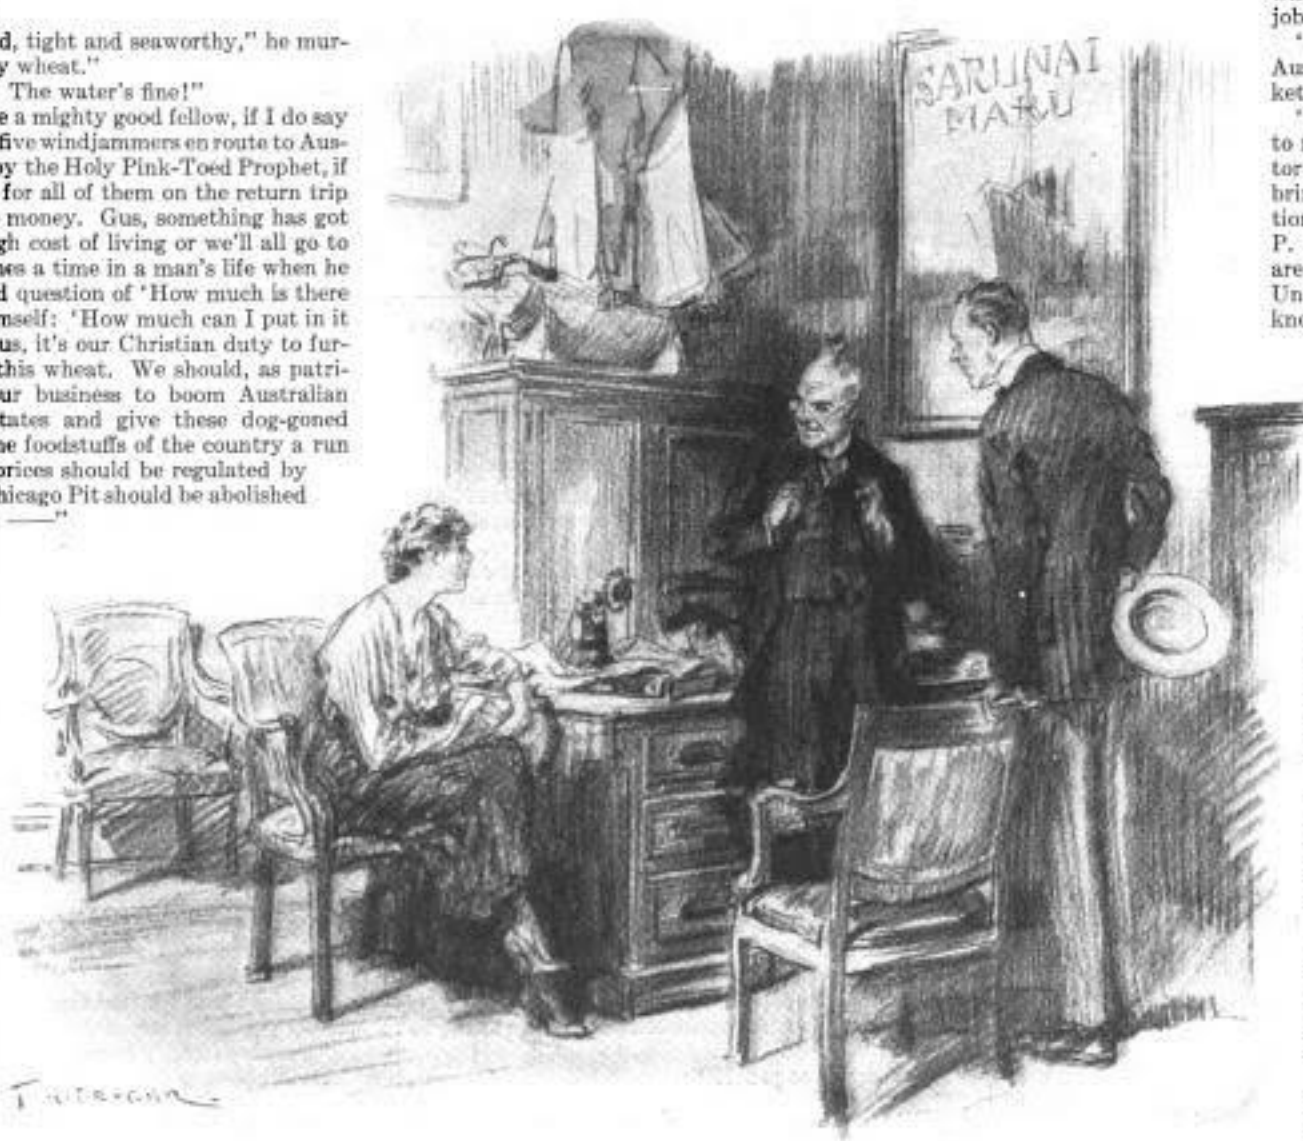
"December wheat closed in the Chicago Pit yesterday at $1.89½, and the market has been very stiff for quite a while. The bulls are right on the job."

"Will not the advent of all this Australian wheat depress the market?" Cappy shrilled excitedly.

"Not unless the bears happen to find it out, Cappy," Redell retorted gently. "It is our job to bring the matter to their attention, for it so happens that Alden P. Ricks and J. Augustus Redell are the only two people in the United States who happen to know about it. Ford & Carter know; but they are very conservative, and I doubt that the tremendous possibilities of this information have occurred to them. At any rate, we'll probably be first aboard the lugger."

Cappy nodded sagely.

"Are you sure, Gus, my dear young friend, that we are not too conservative in selling but a quarter of a million bushels each? There's such a thing as playing 'em too close to the vest, you know."



"We'll try selling half a million bushels first; if that doesn't depress the market we'll just keep on selling until something happens. That's right, isn't it?"

"I think so. The bulls will probably grab that first half million bushels to hold up the market; they may even absorb a million. We'll try 'em, at any rate. What next?"

"Having sold all we can at the market, Cappy, our next move will be to kick the market to pieces."

"How?"

(Continued on Page 68)

"That Will be All, My Dear, for the Present. I Can't Dictate Business Secrets in the Presence of This—Ahem!—Harumph-h-h!—er ——"

THE HOUSE OF CRAIGENSIDE

By Richard Matthews Hallet

ILLUSTRATED BY HENRY RALEIGH

VIII

THE ornithologist was absent but a brief while. Then, with the force of an explosion in our midst, a thing came to pass so utterly odd, and so bound up, as it transpired, with the destiny of the Craigensides, that I feel obliged to describe it in detail.

This event took its rise in the return of Mr. James Smith with the act known as Man or Mechanism. This act, as was to be inferred from the handbills, had to do with a sort of Frankenstein's monster, a thing in the likeness of a man, which would make seemingly independent movements, whether electrically energized or inspired with the very breath of life its proprietor would not take it upon himself to say. That, in short, was what he left to the critical judgment of his audience to determine.

The baggage of the new company came into the Glade late on Monday afternoon. At that hour I was sitting with my senior and colleague, Mr. Bag Fuller, on the canoe float presided over by the boatman Sturgis. Mr. Fuller pointed out with his pipe stem the huge black box which in his opinion comprised the Man or Mechanism act. I had only time to take note of its brass corners and heavy construction, when it was up-ended and urged sidewise onto the stage. The expressmen were straining and shouting curses underneath it, as if the thing were a grievous weight on their shoulders.

"Funny what will amuse people," said Fuller.

He was of the opinion that the act was a fake act, as nearly everything in life was nowadays.

"Ain't no more real than those needles," he said mournfully.

The needles he referred to were pine needles, and were being strewn from carts, among the roots of weary, bald-headed pines.

Sturgis stirred sleepily, rubbed the bowl of his pipe against his nose and uttered:

"I think it will turn out to be a man, not a mechanism."

"Man nothing!" retorted Fuller. "Ain't it likely a man would be given away first crack out of the box. He would cough or get a cinder in his eye."

"There are people with remarkable nerve control," said Sturgis. "I knew a man who went twenty minutes without winking his eyes, for example."

My fat colleague was an opinionated man. He waddled away unconvinced.

Mr. James Smith Was Standing Hatless at the Wheel, Heading for the Open Sea

The policeman at Silver Glade had, in addition to his other duties, that of taking tickets at the theater gate. It was, as I had pointed out, a sapping of his authority and a lowering of his dignity to give him a job beyond that of merely towering impassively among his fellow citizens. But the management that year was bent on economy. Already the road was a squeezed lemon, about to be thrown into some financial gutter.

And thus it happened that on this Monday night at seven-thirty I was "on the gate," as they used to say at Silver Glade.

As darkness fell the arc lights shone more boldly among the debilitated pines. I heard the torturing creak of wooden swings, and the sound of lobster shells snapping when trod on—this in the lucid intervals between the whirls of the merry-go-round.

At a quarter to eight the manager of Silver Glade thrust his sweating face anxiously over the gate.

"It's a good house, isn't it?" he said nervously. "I hope nothing goes wrong with these acts. Outside the Man or Mechanism thing they don't amount to much, I tell you flat. Mostly silent acts, curtain raisers. They've made long jumps too. Slapped together at the last moment. That's what they get, fighting for cheaper acts. These acts have come from five different holes—they don't know each other even."

He went off grumbling.

I then became conscious of the figure of Mr. James Smith lumbering up the center aisle. His head swung like a bull's, right and left; he seemed to be taking stock of the few people who had come in.

Reaching the gate, he stood back in the deep shadow behind me, with only a muttered word or two, and there he remained until the audience was made up and the first act well started. He then went through the gate and made for the dressing rooms. A full minute had not passed when Jane Craigenside presented her ticket.

"Where is Captain Craigenside?" I inquired.

"Wild horses wouldn't drag him here," she replied. "He's not the man to want to be amused."

My thought was that, in her present mood, she wasn't the kind of girl to be amused either, if it came to that. I had never seen any young woman in my life whose eyes gave less assurance of a likelihood of being entertained by what was going forward.

I showed her to a seat myself, and later, getting my colleague, Mr. Fuller, on the gate, I summoned courage to take the empty seat beside her. I was conscious of an agitation on her part which made her reluctant to talk. But if this was how she felt, why had she come to Silver Glade at all?

I confess she puzzled me.

The first act was silent—a pair of acrobats. The second was of the sort technically known as slapstick. One man played a concertina while the other pummeled him systematically with a barrel stave.

Stealing a look at the girl by my side from time to time, I saw that she was watching with a rigid face and that her mind was otherwhere.

Then the Man or Mechanism act was announced, and now the audience shifted on those wooden benches, for this was the act that had been featured, and with the mystery of which even philosophers and sages, it was averred, had not been ashamed to concern themselves. Out of the tail of my eye I saw the girl beside me sink forward and put out one hand to the iron chair back in front of her.

An attendant appeared, rolling out from behind the wing-screen an immense black box studded with brass nails which I had caught a glimpse of earlier. This he placed at the left of the stage and withdrew.

Next appeared a tall, pale man robed in black, with a black skullcap on his head and long straw cuffs at his wrists. This was Mr. James Smith. The ex-ornithologist was certainly master of strange trades as well as a manufacturer of omens. He stood viewing the audience like a man lying in wait, his pale eyes oddly lighted. Indeed, so haunting was this light that judgment was instinctively passed against his experiment before he could so much as open his mouth. This prejudice was heightened also by the molelike protuberance on his forehead.

"Ladies and gentlemen," he unctuously said, "I am a man of few words, and I prefer that you should judge my manikin rather by its own actions than by my account of it. It is the work of my own hands; whether alive or not, you shall judge for yourselves. If motion in the limbs be once granted, you see for yourselves it would only be necessary to simulate the digestive and peristaltic processes to have a completely functioning organism—in short, man. Ladies and gentlemen, I now disclose to your eyes the manikin. Is it man or mechanism?"

He bowed low. Then going to the black box he took the lid entirely clear of the front face of it. Many nervous sighs were heaved in the obscurity below him; a noise arose of divers feet pressing hard on lobster claws and peanut shells.

They were looking into the staring eyes of a waxen figure nearly six feet high, reposing on a half couch of palest rose. The black hair was slightly curly, the nose aquiline, the chalklike features those of a man of perhaps thirty and of great personal beauty. This figure was clothed in black velvet slashed with scarlet stripes.

The face was weird and trancelike beyond words. It was not human, it is true, but neither had it the insipid quality of a face of wax.

And now this strange circumstance was superadded to the others: The girl beside me strained forward in her seat and whispered "It is he!"

Could I believe my ears? Had she recognized this corpselike figure? "It is he!" Who then? And what might be his real relation with the uncanny ornithologist? There was about all of this a child's magic, a fantastic Orientalism, that yet held me spellbound. I leaned forward, expecting I know not what, perhaps that the whole parcel of them would disappear into the gaping jaws of the dragon painted on the canvas wing.

My hand fell on Jane Craigenside's. As before when I had taken it, it was cold; and again I experienced a vague shock that this should be so. It seemed certain that the cold fingers of some horrid fear had fallen on her. And yet in the moment when she had said "It is he" I could have sworn that a note of relief, and even immeasurable gladness, had mingled with that other note of strain and terror.

"It is who?" I said gently, hoping that in that moment of rapt attention the word might fall which would make all clear.

I was disappointed. She shook her head slowly, her eyes riveted to the mechanism, to which the fat operator had now turned back.

"I show you now his inward part," he said suavely, twitching at his straw cuffs. "I trust that it is not all wickedness."

There came a click; a door in the small of the figure's back opened, revealing a collection of springs and cogs—about enough to fill an ordinary alarm clock.

"It must be reflected from the sides—by mirrors," said the girl in the same curiously absorbed whisper. She was quite oblivious of me. I began to see that she wished this thing to be a man—that her whole soul cried out that it should prove a man. Her steady eyes flared with the fierce light I have already noted; the line of the jaw, the pouted lip, the slope of the lashes, all went to emphasize the strain of the barbaric and imperious which was her inheritance

Digitized by Google

from that grim line of seamen who had sprung from the house of Craigenside. She breathed stormily. The black ribbon slung about her neck moved; one point fluttered on my cheek.

But my own attention returned to the stage. Our friend, Mr. James Smith, had flung out on the bare boards a system of wires ending in what appeared to be small bulbs of black rubber.

Speaking slowly, in his thick, grating voice, which seemed to have been long unused, he called the attention of the audience to the fact that the man—or mechanism—was now about to move.

"You will observe," he continued, "that when I press this bulb he walks alone. I have provided him with the floating principle of equilibrium. You all know that the thing which keeps the balance of the human body is afloat in an inner compartment of the ear. This principle I sought to imitate in vain for many years, and I discovered my method only by chance, through feeding domesticated pigeons on bread crumbs soaked in brandy."

A murmur came from the audience.

Mr. James Smith pressed the bulb. There came a whirr, a clack, the left hand of the object shook, the fingers remaining rigid. In another instant, with a faint sound of clicking, the thing stepped out of its box and took a stiff step or two along the stage, its crimson-clad arms dangling.

Mr. James Smith dropped the bulb he had been holding. At once the Man—or Mechanism—came to a halt. The arms twitched spasmodically, and the head canted a little to one side, the eyes, however, continuing wide open and utterly without expression.

"It is necessary," said its proprietor, "to simulate by electrical impulses the effect of muscular contraction and expansion. It is plain that if the peristaltic and respiratory impulses could be similarly simulated, the organism would differ in nowise from man's. It would be possible to nourish it, as a system of normal reflexes."

He then drew from his pocket a small package, and uttering pleasantly the words "Red pepper," slashed it through the air.

Several gentlemen in the front row sneezed. Smith sneezed himself; but the figure in striped velvet remained unaffected. There was something severe and statesmanlike in its profile, actually the same look of cramped greatness which you will see, for example, in the portraits of William H. Seward.

As to the authentic nature of this miracle, people were about equally divided. Some were saying that of course the pepper would not have its effect on sawdust; others averred that the figure was a man who had schooled himself to endure its ravages.

But the girl at my side sat white-faced and silent, following with all her soul the least movement of that perplexing manikin. Useless to recount its bag of tricks. It sat in a chair, it picked a handkerchief from the floor, it raised a china cup to its lips, it put a derby hat on its glossy head. The range of its performance was, of course, narrow; the fact of mere movement on the part of such a contrivance was what was remarkable to those of us whose minds habitually swung open on hinges of wonder. Once when the current of its being was cut sharp off the thing fainted dead away, and lay limp in the arms of its creator, still with its miraculous eyes wide open in that impenetrable glassy stare of which it was past master.

I did not once see the quiver of an expression there. There was not the slightest movement of the lashes, not the least flutter of a lid or wrinkling of skin round the eyeball—movements which chiefly control and determine the expression. I did not so much as detect the pulse of an artery in the neck or an expansion of the lungs, and yet there was a lurking, underlying something there like human personality.

"Has it a soul?" breathed Mr. James Smith in one place. "Ladies and gentlemen, I do not know."

In the very moment of deciding that the thing was a mechanism I had called to mind those swiftly whispered words of the girl at my side, "It is he!" when the lid had been removed from the box.

I seemed to read into that cry something between yearning and despair, a note of unconquerable fierce sadness. It was recognition; yet how should the man Smith have modeled with such fidelity the face of a man this girl had known? Had he perhaps copied these features from a living model? Or was the man himself behind this livid mask? I remembered the trepidation of Craigenside on seeing the ornithologist's bag, and it began to be plain to me that this was no haphazard business.

As these reflections crossed my mind the proprietor of the act said in his suety voice that, for the benefit of those whose eyes might be dim or whose judgment was yet undetermined, the figurine would walk into their very midst and undergo the closest scrutiny possible to be given it.

A runway was brought, a wooden chute, with cleats nailed across it, which we had made use of the week before in connection with the performing horses.

"He is coming down," whispered Jane Craigenside. "We shall see."

"It's Only a Straw Man After All, and Pretty Well Drowned Too"

The manikin hesitated on the verge of the descent, tottered, put out a foot in exact accordance with the elaborate leg action laid down for it, and began the descent.

The strangest feelings flooded through me as I beheld the uncanny contrivance approaching at its precise, shuddering stride. I heard the soles of its boots tap in the wooden aisle. I saw the graven face loom closer; there was a fixed light in the eye, which seemed frozen in the socket, and not the slightest movement of the lids, although a swirl of dust just then passed over the theater fence which set everybody coughing.

With the same mechanical accuracy it came on, dragging its wire, until it was within ten feet of where we sat. At this moment a soul-stirring change came over it. I do not aver that there was so much as a quiver of a facial muscle—the lids were as before, there was no breath in the nostrils—and yet I could have sworn that the look of yearning and despair which I had seen in the girl's face was now reflected in these dark eyes, which only a moment since had seemed as impenetrable as stone.

It was all in a second; a thrill passed through me as my sense of this interchange of profound emotion grew more certain. Already the girl was rising in her seat, her clenched hand pressed into her cheek—when there came a click which had hitherto been no part of the action.

The manikin reeled in its tracks, and I heard the fat Mr. Smith lumbering down the runway. As he wrapped his immense arms hard about the scarlet body of the mechanism he shouted hoarsely:

"The sea wind. Ladies and gentlemen, the air has proved too heavy for it. I ask your kind indulgence ——"

He was back on the stage with the agility of a spider, and in a second had clapped the figure into the box and replaced the lid. At this moment, and before the ornithologist could make his apologies, the girl whispered to me:

"Mr. Weymouth, will you take me out? I am not well."

My hand was already at her elbow; and I hurried her up the aisle, past my soiled and shuffling colleague, whose eye of a boiled codfish bulged with curiosity, and so into the deep shadow cast by the theater fence.

Her white dress was all that was now visible. The dark plumes of the aged pines hung over us like brooding murderers. Step by step I followed her as she made the circuit of the fence. She moved like a sleepwalker, one slim arm outthrust, until at length we stood at the bottom of a rickety flight of outside steps which led into the dressing rooms.

"You can be certain of my discretion," I remember saying. "I am an officer of the law, but I am first of all a man."

The tension was so great that the ridiculous flavor of this assertion passed unnoticed by her. She took her skirts in her hand and began the ascent of the uncertain outside staircase. When she was in the act of turning the knob of the door at the top a loud outcry arose from within—a chorus of voices in which fear and accusation seemed equally blended. It must have been audible even to those sitting in the theater seats.

In one bound I was at the girl's side, and had thrust hastily past her into the alleyway which ran the length of the dressing rooms and separated them from the stage proper. The place was thick with the bodies of partly denuded performers. A sweating strong man barred my way; his eloquent arm shook with soft and complicated muscles. His was a silent act, but he proved to me that he did not lack a tongue.

"I tale you," he shouted, "I haf heard 'eem cry out!"

He pointed to a wooden door on which was stenciled in black paint the figure 3, and now I saw that my colleague Fuller had been before me. He must have run across the stage itself. He was kneeling before the door and staring through a crack in the panel.

I turned to a pale-faced, scintillating young woman, the wife of the strong man, whose dress was hung to her freckled shoulders by the veriest threads of scarlet. She cried madly in my ear that murder had been done in there, and that the other officer refused to break the door down.

Mr. Fuller in truth looked not a little pale. He had committed the fatal intellectual folly, for an officer, of reading too much law; and he was now besieged by a hideous doubt of his legal right to enter without a warrant.

"This woman says she heard a sound like something had fell into the river through the trap," he muttered. "But that ain't nothing more than hearsay."

He glared at the insistent woman with a resentful eye which said plainer than words that she had manufactured this story on purpose to embarrass him. It was, however, perfectly true that the whole place overhung the river. The tide was now running out strongly, and we could plainly hear the piles grunting and squealing together underneath. Flashes of moonlight from the water came through cracks and knotholes in the floor.

"Who is in the room?" I shouted.

"The Man or Mechanism act."

I hesitated no longer, but put my shoulder to the flimsy door and burst it in.

Sturgis Threw Down His Oars and Brought the Thing in Dripping, With a Piece of Kelp Clinging to It

Digitized by Google

Directly opposite me, on a ruined chair, sat Mr. James *Smith*, his skullcap awry, his hands fumbling with a curious nickel-plated pipe which I recognized at once as an opium container. His eyes were calm, but his chest rose and fell strongly, as if after violent effort by one not in the best of condition, and the knoll of flesh on his forehead was *flooded* with a sinister scarlet. But there was not the slightest trace in the room either of the black box or of the hideous and questionable shape that had lain within it. Only in the center of the floor yawned a hole, made by a lifted trap, two-feet square, disclosing the bright chaotic silver of the running tide ten feet below.

"He's dropped him in the river!" quavered Fuller.

"Then search at once," I cried; and closing with Mr. James Smith, I added: "You are under arrest. In the name of the Commonwealth I arrest you."

He mouthed the stem of his pipe, and the glistening astral double lids drew back slowly with their infernal snakish motion.

"What's the charge?"

"You are charged with the murder of an unknown man—your assistant."

The ornithologist here trailed some symbol in the air with his pipe stem. At the same time I noted that the lump on his forehead had lost its red glare and had recovered that peculiar and even loathsome iridescent whiteness.

"My assistant?" he said with a nasty leer. "I had no assistant."

"The thing in the box, then."

"Ah," said James Smith, "if you choose to call a figure stuffed with straw an assistant ——"

His face was as calm as the face of a stone god and his cold eye gleamed.

"The thing you refer to was a toy, a mechanism," he said in even tones. "It failed to work in a crucial moment, as you have seen. In a rage I destroyed it and threw it in the river. Who had a better right?"

I stood aghast at the smooth and horrible plausibility of this assertion. It was a mechanism—and he had destroyed it. What proof had we that it was not a mechanism? We were accusing him of murder, and yet not only the identity, but the living reality of his victim hung in doubt. If it was indeed a thing of rags and wires I should be the laughing stock of a county.

But even while I hesitated Jane Craigenside stood at my elbow. With her hand at her throat she cried fiercely, woefully:

"He lies! He lies! It was a living man. Oh, why do you all stand there talking! Let the river be searched. It may not be too late even now."

These words broke the spell which the assertion of the ornithologist had laid on all of us. I called to Sturgis and Fuller to take boats and proceed along the river's bank, following the tide and keeping an eye out for the black box and its unlikely occupant. I reserved to myself the duty of escorting the prisoner to the jail. Our jail consisted of a double cell, screwed to the floor of a log cabin which had seen service as a lunchroom.

A yellowed sign, "Ham Sandwitches 5 cents," still lingered on the wall.

As soon as Smith was fairly in the cell a shadow of misgiving crossed his bloated face. He gripped the bars.

"Gentlemen," he said earnestly, "I swear to you that what I have told you is the truth."

"I hope for your sake it may prove so," I returned grimly.

While waiting, I held an inquiry among the members of the troupe, but nothing of a positive nature was to be learned. As the Glade manager, Wakefield, had already told me, the five acts had come from five different houses. They had come late, and had hastily occupied the dressing rooms assigned to them. On one point they were all agreed: None of them had seen the supposititious partner of Smith lingering in the alleyway, nor had any of the Glade employees seen him in the Glade. All the others had been seen, and were now identified; but this man—or mechanism—had not been seen. Strange fact! It occurred to me that perhaps the make-up of the man, his utter lack of expression as he lay in the box, had deceived them.

"You see," said James Smith, "there was no such man."

Sweat stood in large beads on his shining brow.

"You may be right," I said; "but I am not convinced of it. You are no fool. Man alive, why should you destroy your means of livelihood? How can you expect me to believe you so infernally childish? It's nonsense!"

"Oh, Why Do You All Stand There Talking! Let the River be Searched. It May Not be Too Late Even Now"

"Truth," he murmured. "I am subject to fits of rage."

He sank back on the stained mattress, and precisely then I had another thought.

"And why—why should you drop box and all in, if I may ask? You had no quarrel with the box, I should imagine."

He did not answer. But then in the very moment when, as it seemed to me, confession trembled on his lips, I heard outside among the pines the noise of a crowd of people coming toward the jail.

"Now, then, Mr. James Smith, we shall see," I said.

In the faint light of the cobwebbed lantern his face was darkened by a horrible uncertainty. He clutched the bars, he swayed, he glinted, he breathed with a hoarse catarrhal rattle in his throat. I assure you I wished myself well rid of him and of the case as well. I was as certain as of anything in this world that the man facing me there was guilty of the most damnable atrocity—the murder of a hypnotized subject.

And suddenly Sturgis burst in with a limp, draggled body slung over his shoulder. The head hung down; some of the pallor had soaked off in the water, but there was no mistaking the hawknose, the black hair, the wide staring eye, and the scarlet trappings of the manikin which had just now paraded upright before our eyes. A system of tangled wires hung from its thigh.

"Here we are," said Sturgis. "It's only a straw man after all, and pretty well drowned too. Man or mechanism, hey? Well, neither, just at present. Not even a good donkey's breakfast."

I glared at Smith. He had entirely recovered his self-possession.

"I suppose I may ask you to unlock this," he said insolently, rattling the door of his cell.

Now in strict truth it was beyond my power to release, of my own accord, a man whom I had once arrested in the name of the Commonwealth. But I thoroughly disliked the notion of being laughed at in open court, and the idea of confessing to that rat-faced little judge, with his feazing goatee, that I had arrested the prisoner on the charge of drowning a straw man made no appeal to me. I therefore unlocked the door to the cell.

"Sorry to have detained you," I mumbled, crestfallen.

My hatred of the man in that moment was as extreme as my puzzlement.

"I suppose I may take my property," he said with a gesture toward the scarlet figure.

I nodded, lowering the lantern. He stooped, picked up the manikin, and in another moment we heard his huge feet crunching among the pine cones and lobster shells. Instantly Sturgis closed a moist hand over mine.

"Quick! Follow him, but at a distance," he said in a shaking whisper. "We are not through with this man yet."

"What the devil ——" I began, staring through the black pines.

"Come, quick," said the boatman. "We have him safe enough, if we follow on."

I followed my friend in amazed silence. The crowd had evidently tired of waiting in the environs of the jail. The curious features of this business had not been noised abroad, and it was thought to be nothing but some sort of drunken brawl of a kind with which those who frequented Silver Glade were only too familiar. The lower part of the Glade was empty when we came into it, and the arc lights were out; but still we could see ahead of us the moving shadow of that mysterious man who carried a scarlet puppet slung over his shoulder.

"He will go into the hotel," whispered Sturgis.

He was wrong. The ex-ornithologist did not go into the hotel. He first came out of the thicker growth of pines behind that building; and then with the moon shining on him, he began to run toward the boat landing as if an imp were in his heels. Once there, and with the same unexpected agility he had displayed in coming to the rescue of his mechanism in the theater, he darted aboard a long, shark-like motor boat which was tied up there, the Fra Diavolo.

The Fra Diavolo was a speed boat, shining in brass and mahogany, and stuffed full of luxurious divans and wicker chairs. It belonged to a youth called String Fortescue, who haunted the Glade as if its nymphs were sacred.

Mr. James Smith cut the painter with a knife. Next we saw him stoop and turn the flywheel over. We heard the engine sputter, we saw the ornithologist straighten up and seize the wheel.

"He will escape after all!" groaned Sturgis, breaking into a run.

"Escape?" I said stupidly. "Escape? But we have let him go."

Sturgis made no answer. He ran forward, only in time to catch in the face a dash of spray from the sheer of the Fra Diavolo, which began to move fast toward the mouth of the river. Mr. James Smith was standing hatless at the wheel. The moon sparkled on his polished dome, and we saw very well that he was heading for the open sea.

"Quick—oars," cried Sturgis, fumbling with the painter of a boat equipped with two sets of rowlocks.

I had never seen him so disturbed. The water slapped over his shoulders, but he paid it no heed. He stared back into the Glade; there was no sound of following footsteps.

"You are crazy as a loon!" I yelled. "How are you going after that thing with oars?"

"Lame engine," puffed Sturgis. "Don't argue. Come on. He may stop any minute."

PHILADELPHIA, FEBRUARY 17, 1917

The New Utopia

PRESIDENT WILSON'S address to the Senate in January was damned with faint praise—or, just damned. To many distinguished preachers, politicians and business men his proposals were "Utopian"; "beautiful ideals"; "desirable, of course, but not practical." To one of our historians they were "asinine."

There was a time in the history of this nation when we made ideals come true by believing in them. America was discovered, settled and preserved by faith in such "beautiful ideals" as are embodied in the Declaration of Independence, which in its day was quite as Utopian as President Wilson's proposals. Nothing is so practical as an ideal in which men believe.

A Call to the Nation

PRESIDENT WILSON'S address is the most important and the most admirable public utterance that has been heard in the United States in many years. It expresses the supreme interest of this country in its foreign relations. The country, we believe, is ready to support it heartily.

We want peace, first for ourselves, but also for the world. This war has made it doubtful, at several junctures, whether we could have peace for ourselves. Through trade, travel, investments, and so on, common world interests interlace more and more closely. Opposing alliances of nations to secure a dubious balance of power grow more and more extensive. Any future war is quite certain to be a great war, and to affect more rigorously those nations that seek to stay out of it. Presumption is all in favor of the President's declaration, some time ago, that we could hardly hope to keep out of another world war.

Peace now depends absolutely upon the will of any nation. If it asserts that its honor or vital interest is involved, the world has no recourse save to submit to an ordeal by battle, even though the whole world may be involved in it. In the present state of the world's development that is a ridiculous situation. There must be some organ to express and assert the common interest as against any particular national interest. No other arrangement contains a reasonable guaranty of peace.

The United States is pretty well agreed as to that. It should be willing, then, and glad, to take its share in establishing and supporting an organ of the common interest. To declare that we want lasting peace, and then sit back and merely advise Europe how it may secure lasting peace, without being willing to take our share in securing it, would be a contemptible rôle. There may be differences of opinion over details; but details are unimportant now.

The idea that President Wilson expressed to the Senate ought to receive the country's hearty indorsement.

Centralized Bank Power

THE Federal Reserve Act became law a little over three years ago. What chiefly recommended it to many people was that it theoretically reduced or neutralized the power over bank reserves which the big banks of Wall Street had long exercised. Evidently, however, it was not concentrated power itself that these people feared; for this act probably concentrated in the hands of a few men greater power over banking than any like number of men had ever exercised anywhere else in the world.

Last September, without much opposition or discussion, the act was amended in a way that increased the power of the central board. At this session of Congress other amendments are proposed that would still further extend the board's power. They would require all national banks to deposit all their legal cash reserves, except five per cent—which is only till money—with the Federal Reserve Banks. They would empower the board, by a vote of five members, to increase the banks' reserve requirements by one-fifth at any time, thereby drawing that much more bank money into the central reservoirs.

Amendments adopted last September or proposed now would increase the central institutions' discretionary powers in handling the reserves deposited with them and in issuing circulating notes. Broadly speaking, half a dozen men could expand or contract bank credits at will, merely by pressing a button.

Not that the amendments adopted last fall or those proposed now are necessarily obnoxious. They may be very useful. But we are always talking about the danger of centralized power; yet in various cases we cheerfully hand over to a few men centralized power to a degree hardly known elsewhere; which finally means that our practice is better than our preaching.

Burying Dead Languages

THE General Education Board, backed by thirty-five million dollars of Rockefeller money, proposes, in coöperation with Columbia University, to try a series of experiments that look toward reorganization of elementary and secondary education. The experimental school will ignore Greek and Latin, and stress modern languages. It will try to find a method of teaching mathematics in connection with the ordinary practical uses of mathematics. Science, industry and the domestic arts will be prominent, and increased attention will be given to music, drawing and the arts.

Every effort will be made to keep the pupils in constant contact with their natural, industrial, social, economic, vocational and domestic environment, so as to derive the basis for their school work from real situations and thus make school work constantly real to them. The theory of education known as formal discipline will be discarded and an attempt made to secure mental training through the study of subjects that are valuable in themselves, and not merely useful as means of discipline.

A highly praiseworthy and promising undertaking, we should say; frankly experimental, with no implication that public schools or other institutions of learning shall adopt this school's recommendations until at least a strong probability of their usefulness has been raised.

Yet we find the proposal ponderously assailed as a blow to culture; an opening wedge to a merely sordid materialistic scheme of education, which, ignoring æsthetic and moral values, will presently make us a race of efficient Hottentots.

The notion that a boy going to sleep over his Cæsar is still traveling in the high road to culture, while a boy all excited over an account of how the Wright Brothers invented a flying machine is in a blind alley, dies hard. All the same, it is dying.

Law and Sense

IT FREQUENTLY happens that after a case has traveled for some years through the courts, and the lawyers have buried it under a whole mountain range of precedents, technical points, ingenious theories and suppositious perils to life, liberty and the pursuit of happiness, the Supreme Court brushes all that aside, looks simply at the essential elements of the case, and decides it according to sound common sense.

Its recent decision upholding the "blue sky" laws of Ohio, Michigan, South Dakota and—inferentially—some twenty other states, is an illustration. These laws were designed to stop an extensive and peculiarly detestable form of swindling. They vest large discretionary powers in state boards. Those powers might be abused. They might be applied in a hidebound, vexatious way, so as seriously to embarrass legitimate investment business. In any event they would impose some trouble and expense upon legitimate business. So lower courts declared them void, as an undue interference with interstate trade in stocks and bonds.

The Supreme Court expresses the kernel of it in few words by saying that the prevention of swindling is within the police powers of the states; and if that does incidentally impose some burden on legitimate business it is for the state to say—within reasonable limits, of course—whether or not the object in view is worth the burden.

Intelligently administered, these laws need burden legitimate business but little. It is for the states to see that they are intelligently administered, with an eye single to keeping out the swindler. We have always believed that precisely the best thing for legitimate investment business was to keep out the swindler.

Investment Tendencies

LIFE-INSURANCE companies—mostly mutual—and mutual savings banks have about ten billion dollars of invested assets. This is much the biggest concentrated investment fund in this or any other country. The investing is done by experts; and the changes that occurred in a ten-year period, as disclosed by a recent report, should be interesting to individual investors.

The biggest item, footing up four billion dollars, consists of real-estate loans, and the next biggest—about half as large—consists of railroad bonds. These two are the prime investments; and the great preponderance of loans over railroad bonds must be viewed in the light of the fact that these investors have well-organized facilities for making mortgage loans.

In ten years loan investment increased more rapidly than railroad-bond investment, especially in the case of life-insurance companies. Their investment in mortgage loans, in fact, increased a hundred and forty-four per cent, while their investment in railroad bonds increased only sixty-seven per cent. At the same time their investment in municipal bonds increased two hundred and twenty-seven per cent.

As the freer agents—investments of savings banks being strictly prescribed by law—the life-insurance companies' changes are the more significant. The fact that they increased their investments in mortgage loans, municipal bonds and public service-company bonds by almost a billion and a half, while increasing their investment in railroad bonds by only half a billion, is not a wholly satisfactory sign; for it suggests a disparagement of railroad investment.

Commercial Failures

TAKING it all round, 1916 was the best business year the United States ever experienced; yet there were seventeen thousand business failures. Compared with twenty-two thousand the year before, this is encouraging; but practically one out of a hundred of all concerns in business failed, and, year in and year out, through good times and bad times, the proportion of failures never varies very far from one per cent.

In only two hundred and sixteen of the seventeen-thousand failures did the liabilities exceed one hundred thousand dollars. Nearly all the failures, in other words, were of small concerns.

Credit men assign many reasons for these failures, such as lack of experience, insufficient capital, injudicious extending of credit, overbuying—which merely means unwise buying—and so on. But we venture to guess that one cause was present in nearly all of them—to wit, poor bookkeeping. They did not keep books so as to know exactly what it cost them to do business and precisely how they stood all the time.

We recommend again to every business concern an accounting system that will show costs accurately.

A Growing Idea

AGRICULTURAL and labor coöperation have been formally sanctioned by Congress. The Government has long informally sanctioned joint rate making by railroads. The new Shipping Act provides that certain agreements among water carriers to restrict competition shall be valid when approved by the board. The act to permit coöperation by manufacturers for export trade will doubtless pass.

We are steadily giving statutory acknowledgment to the plain fact that in various cases unrestricted competition is harmful.

Now the Chamber of Commerce of the United States is urging coöperation that would restrain competition in certain industries based directly on natural resources the known supply of which is strictly limited.

There is abundant evidence that unrestricted competition in soft coal mining works badly, for it leads directly to great waste. A recent report by the Department of Agriculture shows that timber is in somewhat the same condition. With keen and unlimited competition among lumbermen, many of whom are holding great areas of timberland that will not be available for market for years, but upon the capital investment on which interest must somehow be earned, there is wasteful overproduction every now and then; the most conservative methods of cutting are not followed, and there is very little attempt to reforest the cut-over areas, though, as consumption exceeds Nature's growth of the forests, this is bound in time to lead to shortage and still higher prices.

The Forest Service recommends coöperation among lumbermen—not extending to the fixing of prices or limiting of output—as a partial remedy.

WARM DOLLARS

By Frank Goewey Jones

ILLUSTRATED BY CHARLES D. MITCHELL

A STOCKY young business man strode resiliently down lower Woodward Avenue and wheeled into a cross street near the river. John Kent's brisk walk in the September sunshine had splashed his smooth, lean cheeks with pink. His brown hair crinkled moistly along the edge of his forehead. Vitality bubbled in his blue eyes.

He approached the entrance to a low, short building. "Gordon Machine Shop—George Gordon and John Kent, Proprietors," was painted in sooty white on the red bricks. The tread of the junior partner had been elastic; but as he opened the office door his whole body became taut. He marched in self-consciously and spoke a formal salutation to the only other occupant of the little room.

"Good morning, Mr. Gordon!"

The tall figure that stood near a side window twisted about at Kent's entrance. The bent broad shoulders stiffened. The brooding gray eyes instantly turned hard. The shock of grizzled tawny hair and the crisp beard seemed to bristle, all at once, like an old lion's mane. A leonine voice growled from the deep chest:

"Good morning!"

The bookkeeper and the stenographer were not due to arrive until half past eight. The partners continued alone in the cramped plain office, but they exchanged no speech after greeting each other. Kent sat down at a flat-top desk. He swiftly opened and sorted the pile of mail on his blotter. Gordon stood, almost rigid, beside the window until the young man crossed the room and set a tray of letters on the big table in the farthest corner. Then the head of the firm stalked to his place.

Kent unlocked the safe and stuffed a handful of customers' checks into the cash drawer. He turned and looked wistfully at his partner. John had racked his wits for the last nine weeks trying to determine why his business associate and foster father had altered suddenly in mid-July from paternal affection to cold dislike. A dozen times he had begged or demanded the reason. The dour Scotchman always refused to explain. Yet now Kent longingly repeated his question again:

"Spit it out, dad, won't you?"

The stern, proud old face gave no sign that the veteran master machinist had heard the appeal. The stony gray eyes were not lifted from the letters on the corner table.

Though Kent felt innocent of any dereliction, he hung his head as if he bore a shame. For half a minute after his rebuff the young man quivered in front of the safe. Then he trudged heavily from the office into the little shop.

The moment the junior partner closed the door between Gordon and himself his resilience began to return. He greeted the workmen cheerily as he traversed the aisles lined with closely set machine tools. The first smell of oily metal was an elixir to John every day. His blood raced now like the belting. His pulses throbbed in harmony with the rhythmic jar of the punch presses and automatically shifting turret heads. His eyes held such sparkles of lightning as danced on the bright commutators of the motors.

But this morning his tingle of satisfaction in the busy shop dulled very soon to an ache of lonesomeness. Kent missed more than ever before the stalwart, kingly old fellow he had left in the office. Each successive day of the last two months he had yearned increasingly for the comrade presence of "dad" beside him whenever he made the rounds of the factory. They had been like father and son for years. Gordon had taught Kent his trade. The pain of their estrangement had grown unbearably poignant to the young man.

John did not want to return to his desk, though the familiar clatter of the shop no longer soothed him but jangled his tense nerves. He impulsively decided to call now instead of later, as he had intended, at the Walling Engineering Works down the street, where he was having built the first model of a carburetor he had invented recently. Kent left the Gordon Machine Shop by a rear exit. Five minutes later he entered the dingy big office of Henry Walling.

The automobile engineer, a prematurely bald, barefaced man in rusty black, squatted behind a low drafting table. His long neck and narrow shoulders were stooped close to some blue prints outspread under his fingers. He peered above his steel-rimmed spectacles as the door unlatched. Then, with hurried furtiveness, he scrolled the papers and straightened. Walling acted as though he had come close to detection in guilt. He laid the blue prints stealthily on the drawing board and creaked a greeting meant to sound cordial:

"Well, well, John! I'm certainly glad to see you! I didn't expect you to come over the very first thing. This is fine!"

His fulsome words and hoarse tone rasped incongruously, as if the oil of geniality had been so unfamiliarly applied that the harshness of his natural expression grated in his voice despite the copious lubricant. His metallic chuckle

Kent Looked Back, But There Was No Sign of Pursuit

was like thin, brittle steel cracked into clinking fragments.

Walling minced round the draftsman's table and effusively clutched the palm of his visitor. Kent pulled his hand away from the bony fingers after the briefest grip in return.

"I just dropped in, Walling, to tell you I appreciate your proposition on my new carburetor; but I prefer to swing it in the Gordon Machine Shop, along with my other automobile specialties."

The disappointed sycophant turned vicious in a second.

"So you refuse my offer of fifteen thousand dollars," he snarled, "and intend to present half of your latest invention to that fossilized partner of yours!"

"Cut out slurs at Mr. Gordon!"

The warning was snipped off as if Kent's lips had been shears. His eyes hardened to the blue of tempered steel. The engineer, in trepidation, blurted a hasty palliative.

"I respect the old gentleman as a first-class machinist. Everybody does. For twenty-five years George Gordon has been generally recognized as Detroit's best independent master mechanic. But you know as well as I do that he's prejudiced against the automobile business. Even now he thinks it's just a craze, which will die out pretty soon. Why, if you give him a half interest in your carburetor he'll choke all its chances to death in his dinky machine shop."

Walling dropped disgustedly into his chair behind the littered desk. Then he made a sudden fresh attack on Kent's purpose. He swiveled about and swung forward like a rapid-fire gun.

"You've never mentioned your latest invention to your partner, have you?" he shot out.

"No; I'm going to surprise him with my carburetor as soon as you get the model done."

"Well, you won't!" Walling denied bluntly. "He's known all about it for months."

Kent rushed across the room and crouched in menace before the desk.

"You told him!" he accused. A flash of intuition had given the junior partner his first glimpse of a reason for his associate's resentful coldness of late. "You wanted to cause trouble between dad and me so you could drive us apart and get me to hitch up with you instead. You let him know I was having you build a model that I'd never mentioned to him. Of course he misunderstood my purpose in ordering the carburetor made here secretly."

"I didn't tell Gordon anything!" Walling hotly repelled the charges. "I hadn't spoken to him for six months until last Wednesday. He came up here to my office that afternoon and asked me point-blank about the carburetor. I've no idea how he learned I was building the model—unless he picked up a hint from some workman."

"I apologize!" John made hasty *amende;* then he put an eager request: "Tell me everything Mr. Gordon said."

He smiled in anticipation of hearing the cause of his partner's recent hostile behavior.

"What are you laughing at?" Walling demanded indignantly.

"Why, dad hasn't spoken a civil word to me for two months. I couldn't imagine why. I see now that he's been grouchy because he thought I was underhanded about the carburetor. It makes me laugh to think how he'll look when I tell him the real reason I kept it secret from him."

Walling leaned back in his seat. A grin wrinkled his crafty face, as if the unaccustomed inward warmth shriveled the dry skin. A chuckle of satisfaction rustled harshly from his throat.

"You're all wrong, John!" the engineer croaked. "You don't savvy Gordon any better than he understands you. I knew you both were tangled. That's why I phoned you to come over. I'll get you straightened out; then I'm sure you'll change your mind about giving him half of your carburetor. You'll accept the proposition I made you, instead, and become my partner. Sit down. I'll tell you some things you ought to have known long ago."

Kent's buoyant new hope for restored affectionate relations with his foster father was punctured. He collapsed in a chair.

"What do you mean?" he cried fearfully.

"Gordon doesn't want a share in your carburetor!" Walling exulted. "Probably he did feel hurt because you kept it secret; but that is only one reason he's sore at you. What he bitterly resents is your jamming his old shop full of 'newfangled contraptions.' That's what he called your automobile specialties. He still expects the motor-car business to blow up any day, and it made him wild to find out you are going to take on another device in which he has no faith.

"He told me your inventions monopolized the machine tools—that the firm was handling practically no custom jobs nowadays. It drives him frantic to think that you intend to crowd from his old shop more of the familiar work he has done for a quarter of a century, which he knows is safely profitable, in order to run additional chances by manufacturing a new carburetor. The old fogy declared he'd be glad if every one of your specialties was out of the place."

Kent stared blankly; yet he was not so stunned by surprise as he appeared. John seemingly looked at Walling, but he saw only the loved face of the crotchety "old fogy." His eyes were fixed because his thoughts were concentrated on his personal problem in its new light. The engineer misconstrued Kent's silence. He seized the apparently favorable opportunity to urge his own plans again.

"Gordon would be a great deal more contented if you'd give him back his shop to potter round in with jobwork for his old customers. Now I've offered to organize a fifty-thousand-dollar corporation with you to make the carburetor. I'll put up twenty-five thousand cash for half the capital. For the other fifty per cent of the stock you invest ten thousand dollars of your own as a guaranty of good faith, and assign your rights as inventor in exchange for the remaining fifteen thousand.

"In addition I'll give my technical knowledge as an automobile engineer to the company for a merely nominal salary—say a thousand dollars a year—while you'll draw five thousand. You'll soon be a rich man if you come in with me. Our company can take over your other specialties, too, a little later, if you're willing. We'll issue additional capital stock to cover them. Now what do you say?"

While the voluble engineer expatiated on his program Kent was comparing in his mind the greedy little fox and the stalwart old lion of the machine shop. All at once John's filial respect and love for Gordon surged overwhelmingly from the depths of his heart. On the crest of the wave curled the froth of his dislike for cunning, sordid Henry Walling. At the avid question Kent leaped to his feet.

"What do I say?" he foamed. "That I'd rather give up all my specialties and earn five warm dollars a day as a machinist at the bench beside Dad Gordon, as I used to

Digitized by Google

do before he took me into partnership, than to share a hundred times that much with you! You're just a money-making machine! He's a regular Man!"

When the swelling billow of his feelings broke into the spume of speech Kent had backed with repugnance from the desk. At the conclusion of his outburst he whirled to the door. As he turned suddenly to leave the room his hand struck the drawing board. The blue prints the engineer had furtively scrolled when he first caught sight of his early morning visitor dropped to the floor. John bent to pick them up. The roll loosened in his fingers. His eyes glimpsed the fine print in the upper left-hand corner of a sheet:

K-W Carburetor
John Kent and Henry Walling
Inventors
March 7, 1916

Kent's scornful words seemed to have paralyzed the astounded engineer. He had acted confidently in renewing his corporation proposal. When his scheme was flung aside with aversion he huddled behind his desk like a clutter of rusted junk. But as Kent stooped to retrieve the fallen blue prints Walling sprang from his chair as though animated by sudden terror.

"Get out of my office!" he shrieked.

John was dumfounded when he saw his name on the drawings joined with that of the engineer as co-inventor of the carburetor. He did not comprehend yet what the caption signified, but he was enraged, after the first shock of astonishment. Like a menacing bulldog he faced the little man behind the table and snarled his ferocity:

"What's the meaning of this?"

Instead of answering, the panic-stricken engineer bolted through the rear exit of his office to his model-making room and slammed the door. John leaped in chase, but a lock barred pursuit. He shook the knob savagely; then he heard the rush of many feet and Walling screaming frantically to his workmen:

"Kent's got some of my drawings! Take them away from him! Quick!"

John bounded across the office to the front door and clattered down the stairs. He darted round the corner and up the street toward the Gordon Machine Shop. He looked back, but there was no sign of pursuit. Kent slackened his gait to glance over the roll of papers he gripped.

The blue prints constituted a complete set of drawings of his latest invention. With the exception of the extraordinary notation on them, John was familiar with everything in the dozen sheets. Walling's model-makers had been referring to such drawings for their guidance while they constructed the sample carburetor. The detailed original tracings of Kent's new motor specialty had been made by the engineer's draftsmen as part of the work on the order the inventor had given for the building of his first model. John had seen many similar blue prints before; but on none of the other had there been the corner notation, in fine print: K–W Carburetor—John Kent and Henry Walling, Inventors. March 7, 1916.

Kent hurried back to the Gordon Machine Shop. He intended to explain away in a jiffy his partner's misunderstanding about the carburetor; then to ask the shrewd old Scotchman whether he could guess the meaning of the words which indicated that Walling had some villainy afoot. John never before had felt so urgently in need of counsel from his foster father. But he found that in his absence Gordon had left the office. The bookkeeper did not know where he was.

The junior partner hesitated a few moments, undecided what he should do. Then he rushed from the shop to consult his patent attorney. He poured out his story. The lawyer listened with grave attention, asked a great many questions, and at the end shook his gray head portentously.

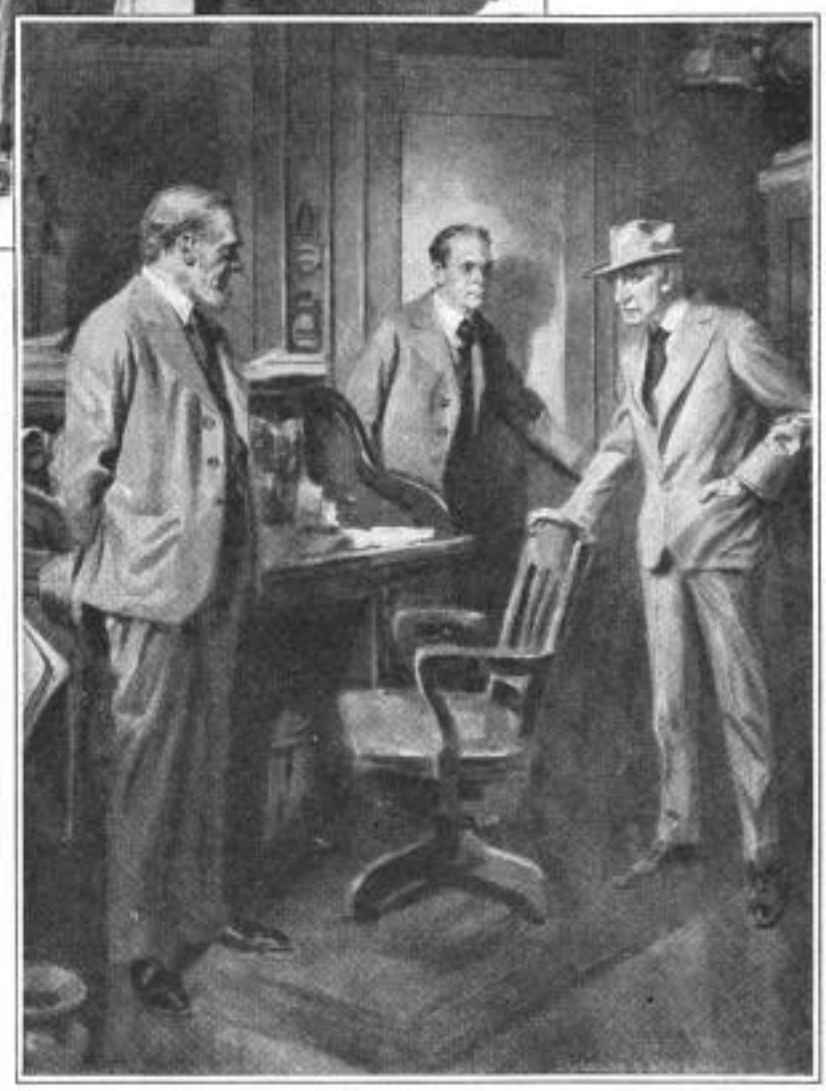
"Walling has schemed to get a half interest in your carburetor by fair means or foul, Mr. Kent. I surmise that every employee of his who worked on your model received blue prints like these, with your name and Walling's in the notation to indicate you were joint inventors.

"Probably the carburetor is commonly known as the K–W at the Engineering Works. Your frequent consultations with Walling about it at his office in the presence of various workmen supported the general assumption that you and he are partners in the device.

The Bank Had Refused to Cash His Check, Because Gordon Had Drawn Out All But a Few Dollars of the Firm's Balance

"You say you have seen many blue prints without the K–W label. Walling doubtless printed those before he had the heading put on the tracings for the special purpose of hoodwinking you. It was necessary sometimes for you to refer to a blue print when instructing mechanics at the Engineering Works. On such occasions I assume that Walling produced from his private safe, for your inspection, drawings with the corners blank.

"The omission of the inconspicuous label was not apt to attract the attention of the model-makers present, intent on the orders you and Walling were giving them about their work. If those employees should be questioned in court they would swear in perfect good faith that the prints you handled in their presence did bear your name and Walling's, to designate the joint invention of the carburetor. In all other respects such prints, of course, were exact replicas of those used by the workmen at their benches in the experimental room. By handling the drawings, though they actually had no labels, you seem to have acquiesced tacitly in Walling's brazen claim to equal rights with you to the new device. The rascal will perjure himself in the Patent Office; his workmen and the circumstantial evidence will support him."



"But he offered to buy a half interest!" Kent reminded him desperately.

"Yes; he'd rather not run the risk of perjury if he can accomplish otherwise his object of participating in the rich profits of manufacturing your carburetor. He hoped you would accept his offer to form a corporation.

"His crooked scheme was the second string to his bow."

"What would you advise me to do?" John appealed to his counsel. He realized his predicament now.

"There seem to be only two things you can do," the attorney replied. "You must either fight a long, expensive interference proceeding in the Patent Office, or assent to the sale of a half interest in your invention to Walling. He has made you a pretty good offer, in my judgment. It appears to me, also, that Mr. Gordon does not want to have anything to do with manufacturing the carburetor. I know how you feel about being held up; but, after all, you'd not be a loser by going into the proposed corporation with Walling. You'd still have fifty per cent of the profits you've expected to keep for yourself."

"You Can't Make the Carburetor in That New Factory! Gordon Has Nothing to Do With That!"

The client instantly flared to rage at the advice of the lawyer. He grabbed the roll of blue prints and strode abruptly to the door. John's wrath exploded over his shoulder toward the astounded attorney.

"I'll see him in hell first! Good-by!"

Kent went back to the Gordon Machine Shop. His partner was still out. John locked the roll of blue prints in his desk and sat down to ponder his problem alone. He cudgeled his wits for an hour; then he decided there was only one answer. A fight in the courts would likely be futile, as the lawyer had warned.

Action followed immediately after decision. Kent returned to the Engineering Works and opened the door of the private office. He found Walling seated at the desk in the farthest corner. As John walked in the engineer sprang to his feet; but Kent stopped just inside the entrance to the long room.

He acted only sullen now, as if his recent violent rage had been spent.

"I won't touch you. I've come back to do business," he announced curtly, like a beaten man surrendering with very bad grace.

"Do you mean you'll accept my proposition to buy a half interest in the carburetor?" asked Walling suspiciously. He edged toward the rear door.

"Yes; I see you've got me foul. I've consulted my patent attorney and he says it's about an even bet if I should fight you, with the odds in your favor. Besides, I'm convinced now that Mr. Gordon doesn't want to manufacture the carburetor.

"He and I can't continue doing business the way we have been pulling against each other lately. I'm compelled to make a new arrangement of some kind. I admit frankly that I don't want an expensive patent litigation with you. I might take the satisfaction of breaking your neck; but I've decided I can't afford that luxury, either. I do not believe it ever will be to your interest to skin me again. You think I can make more money for you if you give me square treatment hereafter. So I've concluded to drop the idea of getting even personally, and to look at the matter from a strictly business standpoint."

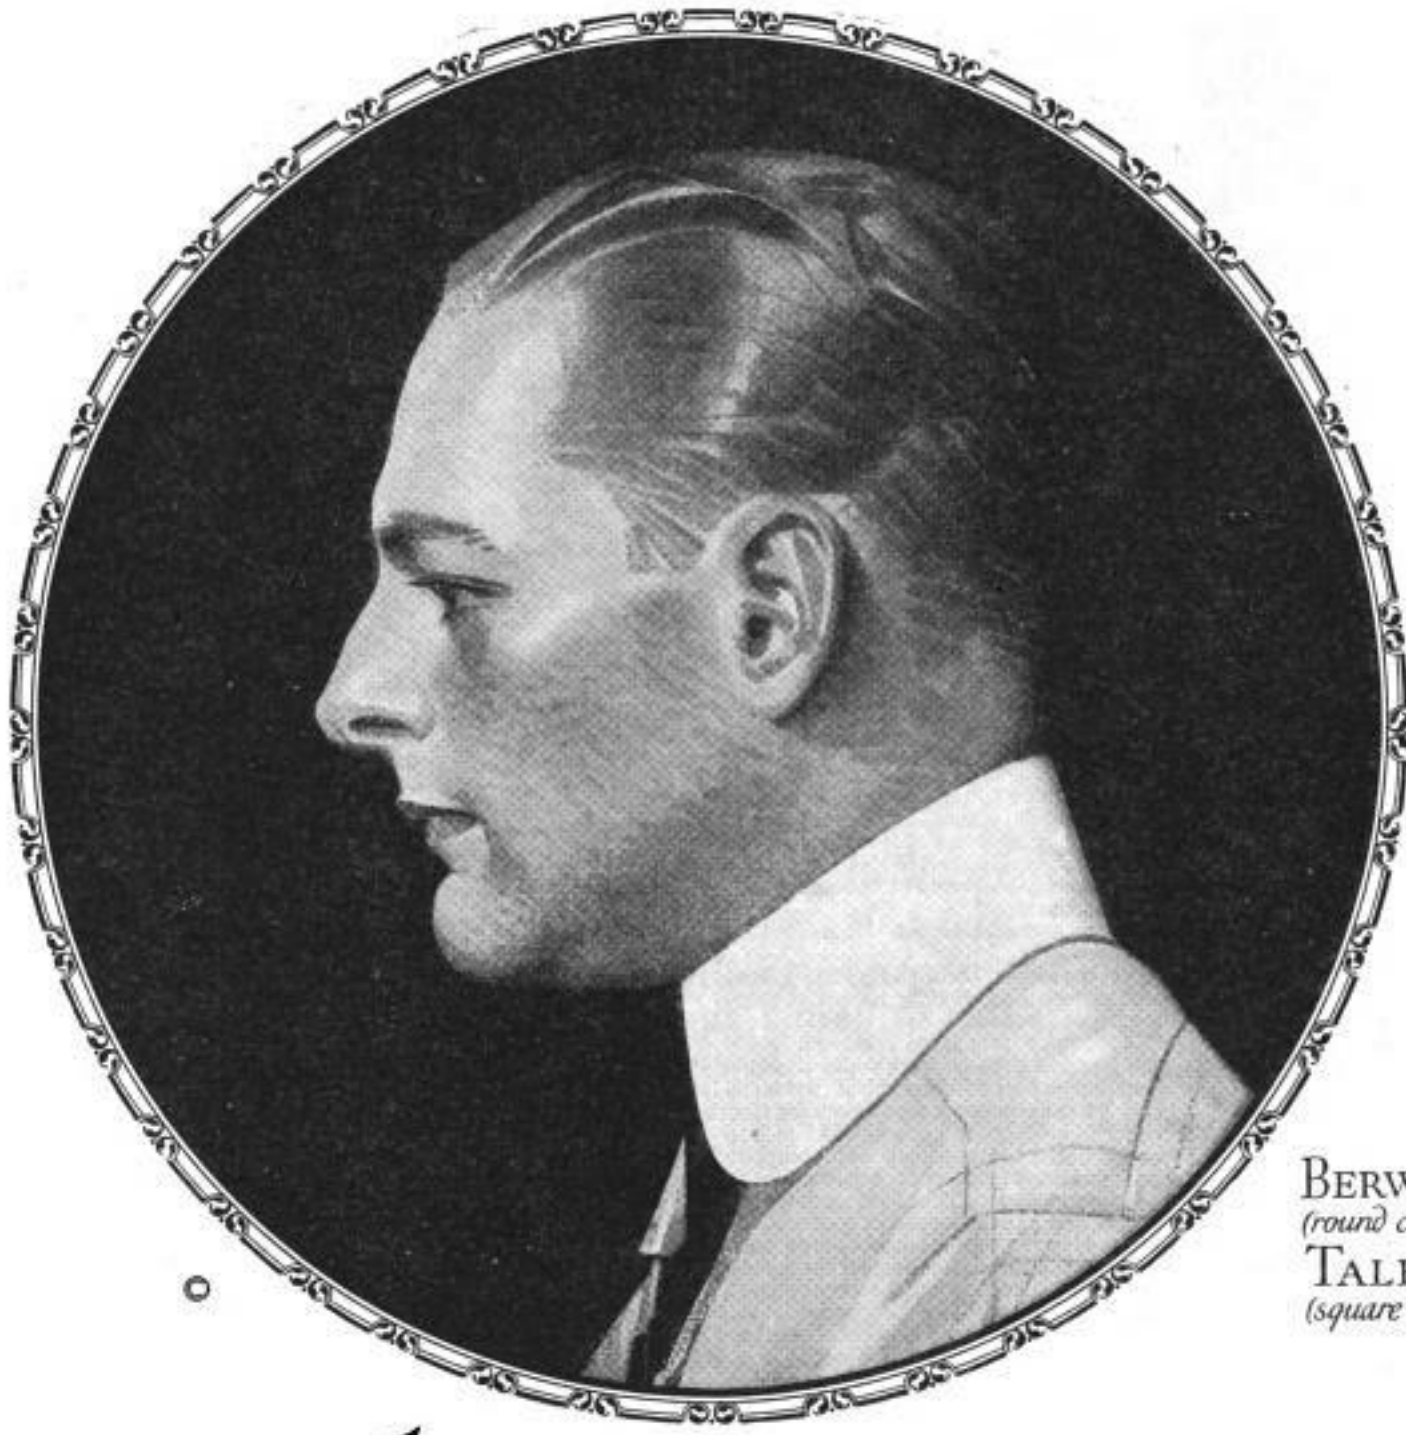
"That's the right view to take!" Walling interjected eagerly.

"It's the only sensible view. I've thought the whole thing over. I believe that when you said we'd both get rich if we should join forces you realized it would pay you to play fair with me."

"We'll not have a bit of trouble," the engineer avidly assured.

"I think the same. Now to get down to brass tacks: I'll agree to assign all my rights in the carburetor to the corporation you proposed. We'll each take half the stock. You are to put up twenty-five thousand dollars cash, and I'll put in ten thousand. My carburetor rights are to go in for the remaining fifteen thousand dollars of my share."

The engineer stared half a minute searchingly at the grim face confronting him. He evidently decided there was no more physical danger to fear; so he came forward with hand outstretched.



"It's a go, John!" he exulted. "We'll make a great team."

Kent held his arms stiffly at his sides.

"No; I won't shake hands," he refused. "I'm willing to let bygones be bygones, but I don't mean to act friendly just because we own stock in the same corporation. I was sentimental when I talked to you early this morning." John affected to sneer self-contemptuously. "I spoke of warm dollars! But this deal is simply cold business

Are Your Eyes
as good as your memory?

Sometimes you look up from the Present into the Past, with all its memories. It is easy to do that.

But, here in the Present, are you able—

to look up from near objects and, without changing or removing glasses, see distant objects clearly?

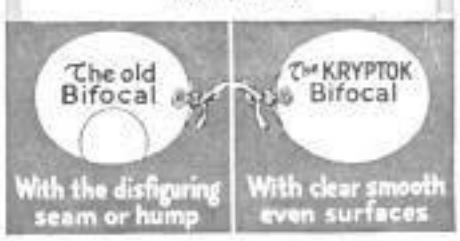
Have you lost, with the passing years, that splendid eyesight of youth which could instantly adjust its vision from near to far?

KRYPTOK GLASSES
THE INVISIBLE BIFOCALS

Enable you to see both near and distant objects as clearly and distinctly as with the eyesight of youth.

KRYPTOKS *(pronounced Cryptocks)* end the trouble and annoyance of removing your reading glasses every time you look at objects more than a few feet away. They free you from fussing with two pairs.

They are making the old-style bifocals, with the disfiguring seam or hump, a thing of the past.



KRYPTOKS keep your eyes young in *looks*, as well as in *usefulness*, because they do not have that age-revealing seam or hump of other bifocals. When you are wearing KRYPTOKS, they cannot be distinguished from single vision glasses. Their surfaces are clear, smooth and even—free from line, seam or hump.

Ask your oculist, optometrist or optician about KRYPTOK Glasses.

Write for Booklet, "Eyesight Efficiency"

It contains important information for every man or woman who needs glasses for near and far vision. When writing, please give (if possible) name of your oculist, optometrist or optician.

KRYPTOK COMPANY, INC.

with me. The less there is of anything else the better—so far as I am concerned. The question now is: Are you ready to sign an agreement?"

Walling was not disconcerted by the rebuff. He instantly met the other man on the ground of business.

"Yes," he replied crisply.

"All right, then," responded Kent. "I want our understanding in black and white at once, so I can go back and settle my affairs with Mr. Gordon too—right away. I'm going to pull my specialties out of his machine shop and let him have the old place to potter round in all he wants. You hit the nail on the head about him."

John's tone seemed bitterly scornful. It had the intended effect.

"Gordon never appreciated you!" Walling exclaimed. "I do. Maybe I did mean to go after you pretty strong on the carburetor, but it was only because I realized what a lot we could accomplish together." The crafty engineer followed this attempted extenuation of his crooked design by showing his greed. "I hope," he urged, "that you and I can handle all your automobile inventions in our corporation."

Kent stiffened as if he drew back from a scented danger.

"First, I wish to see whether or not you really mean to give me a square deal," he declared bluntly. "I don't trust you, and make no bones about saying so. I'm willing to start on the carburetor; then I'll consider putting my other specialties into the corporation. One thing, though, I'll say now: I'm going to take my inventions out of the Gordon Machine Shop just as soon as I can make satisfactory new arrangements. And, of course, I'd prefer to have all my specialties manufactured at the same place as the carburetor."

Walling seemed satisfied. He rubbed his hands zestfully.

"Let's go down town and have our lawyers prepare the necessary papers at once, then," he proposed.

Kent impatiently shook his head.

"I haven't time to wait while a couple of attorneys fuss over technical contracts. What I want now is positive assurance that you mean business, so I can go right back to the Gordon Machine Shop and complete arrangements to pull my specialties out of there immediately. That is even more important to me than the carburetor deal. It will take lawyers several days to organize a corporation and to attend to all the details of the proposed agreement between you and me. I'm going to have a settlement with Mr. Gordon at once; but, first, I need to know just what I can count on with you.

"Walling, I want you and myself to sign now a rough statement of what our agreement is to be. We both know what you proposed, but I intend to have it in writing before I notify Mr. Gordon that I'm going to leave his machine shop with my specialties. So that I'll be sure you won't back down, I insist that we both put up our checks at once with a neutral bank, to be exchanged for capital shares as soon as the corporation is organized. I will agree now, too, that I'll assign all my rights in the carburetor to the company for fifteen thousand dollars of the stock. I wish to know exactly where I stand with you before I quit the Gordon Machine Shop with my inventions. And I mean to give my present partner notice of my withdrawal immediately."

"But how can we make an agreement that will be binding without our attorneys to draw it up?" Walling demurred. "Neither of us knows how to prepare a legal contract."

"Oh, bosh!" Kent scoffed. "What's difficult about putting down in writing the things we've talked?"

He strode to the engineer's vacated chair and sat down at the desk. He pulled a sheet of paper toward him and snatched up a pen.

"I'll show you what I mean," he declared. "Our lawyers can embody our understanding in formal contracts later, if necessary; but I haven't time to monkey round waiting. If you mean to be fair you won't have any objection to signing your name to precisely what you offered orally. And you can't blame me for being unwilling to pull out of the Gordon Machine Shop just on the basis of your word that you'll go in with me on the carburetor, as you proposed. I'll test your intentions right now, Walling. If you have anything more up your sleeve I'll make you show it."

"I haven't!" the engineer protested earnestly.

"Then you'll sign this with me," insisted Kent.

He began to write and in a few minutes had filled two sheets with a hurried scrawl. He stood up to read the paper.

"Henry Walling and John Kent, in consideration of their mutual promises and benefits hereunder, agree:

"FIRST. As soon as possible they will organize a corporation under the laws of Michigan, with a capital stock of fifty thousand dollars. Henry Walling agrees to pay twenty-five thousand dollars cash for one-half of the corporation stock. John Kent agrees to pay for the other half of the stock as follows: Ten thousand dollars cash and fifteen thousand dollars by assigning to said corporation as soon as it is organized, which shall be within thirty days after this date, all his right, title and interest in an improved carburetor he has invented, of which Henry Walling has been building a model and has complete drawings. The two parties agree that John Kent's right and title in said invention are worth fifteen thousand dollars and that fifteen thousand dollars of the capital stock of the corporation to be organized shall be issued to John Kent when he makes the assignment above mentioned.

"SECOND. The parties agree that immediately after the corporation shall be organized John Kent shall be employed by said corporation, at a salary of five thousand dollars a year for five years. Henry Walling also shall be employed, at a salary of one thousand dollars a year for five years. Each party shall have exactly equal power with the other in the corporation management so long as he continues to own or control one-half of the stock.

"THIRD. As evidences of mutual good faith, John Kent agrees to deposit with the Motor Trust Company, of Detroit, Michigan, forthwith, ten thousand dollars; and Henry Walling also agrees to deposit with said Motor Trust Company twenty-five thousand dollars. Both parties agree that said Motor Trust Company shall hold said deposits in escrow until the corporation above mentioned shall be organized. Then said Motor Trust Company shall pay the entire sum of said deposits into the treasury of said corporation, and shall receive for the same thirty-five thousand dollars of the stock of the corporation—twenty-five thousand dollars in the name of Henry Walling and ten thousand dollars in the name of John Kent.

"FOURTH. All the stock herein mentioned shall be full paid and nonassessable; and the assignment by John Kent of his carburetor rights, as above provided, shall entitle him to receive fifteen thousand dollars additional of the capital stock, the same as if he had paid for the same in cash.

"FIFTH. Henry Walling admits that John Kent is the sole and exclusive inventor of the carburetor, a model of which Henry Walling is now making in his experimental department. And Henry Walling admits that he himself has no claim on said carburetor as a joint inventor thereof."

Kent finished his reading and handed the sheets to the engineer.

"That's in the rough, of course, Walling; but it's perfectly plain, isn't it? I'm willing to sign that. If you mean to be square with me you'll sign too, just as readily as you talked the proposition. Then we can go right over to the Motor Trust Company and deposit our money."

The engineer evidently was disinclined to being hurried into a written compact; yet obviously he also feared to demur, lest impulsive Kent should misconstrue his hesitance. Walling read and reread the paper. He tried again to persuade the other man to wait until their lawyers could prepare a formal contract. John stubbornly demanded that Walling show him wherein the present draft did not state their agreement exactly. The engineer was unable to deny that the written proposition was precisely what he himself had urged. He did not take any exception at all to the last clause, in which he would confess that Kent was sole inventor of the carburetor. That was not a debatable point, as Walling seemed to recognize.

"If I've written just what you said, why aren't you willing to sign it?" was the question Kent hurled back at every objection.

Finally, when the engineer could make no more specious excuses for a delay that he seemed both to desire and to fear, he agreed to Kent's ultimatum. He called a stenographer and two copies of the document were made. Thereupon both men

THIS is DIMUNETTE ¼ actual size. Fully protected by patents, easy to operate, extremely light in weight, of handsome brushed bronze effect and solid construction. It gives all the protection of high priced machines, and will last forever.

$7.50
IN CANADA $10.

"It's a crime to take your money"
(But $7.50 prevents that crime)

IT'S a crime to take your money laughed a famous check-raiser as he demonstrated his art. A stroke of his pen—and $8 was $8,000! A drop of acid in the right place—and there was plenty of room to change "Eight" to "Eight thousand"! No wonder check-raising attracts so many criminals. "It's a crime to take your money"—a cinch of a crime to commit—desperately hard to detect because your checks pass through so many unknown hands.

Formerly devices giving Standard Protection were expensive. But now that day is passed. Now you may stand better with your banker by giving your checks standard protection at a price you can afford to pay.

Now the Dimunette gives you Standard Check protection for $7.50—less than you would lose by having one $1 check raised to $10. Can you afford *not* to invest $7.50? The oldest makers of check protecting devices now bring standard check protection within the reach of all.

If you have the slightest difficulty in securing the Dimunette of your stationer or office supply dealer, send check, money order, or draft to us, and we will gladly supply you, charges prepaid.

Gold-Mining in a Grocery

I "pan" figures for profit in my Seattle grocery the same as I used to pan "pay dirt" on the Klondike

By
A. E. ANDREWS, of the Park Grocery Company

When I left the Klondike hills to go into the grocery business I didn't give up all my former methods.

I wanted to know how my labor "panned out" in profits, and I wanted to know this *every day*.

But my first records were like those of many other grocers—they didn't tell me where I stood.

The facts were there—like nuggets in the gravel—but they had to be brought to the surface.

I got a Burroughs Figuring Machine to do the work of reducing my ore, as it were, to tell me how I was making my "claim" pay.

I Had to Reduce Items to Totals

To get the facts I had to add items and get totals—and that's where the Burroughs first proved invaluable. It added rapidly, and the totals, computed automatically, were always right. I never could have secured the results quickly enough with pencil and pen.

My Daily Report Should Interest Every Retailer

The slip shown at the left is made out daily. I get these figures with the Burroughs in less than half an hour. Think of it!—all this vital information obtained in only a few minutes each day.

I have a credit register for taking care of charge sales and a cash register for handling cash transactions.

Each day the charge sales are totaled, the cash received on account subtracted from this total, and the balance added to the previous day's total of outstanding accounts.

Accounts payable are handled in the same way.

By adding checks drawn each day, and subtracting this total from the balance brought forward plus the day's deposit, I keep the amount of my bank balance to date before me.

The charge slips are made in triplicate. One copy goes to the customer, one to the credit register, and one to the figuring machine. It is only a few minutes' work to add the charge and cash sales for the day, obtaining total daily sales.

The Burroughs is Always on the Job Somewhere

When I have completed my daily report the machine is free for general use about the store. For instance, it is used to check each account before the bill is paid. Customers like to receive the machine slip, for it is their protection against overcharges.

By detecting undercharges that would have otherwise got by, the machine has more than paid for itself.

I'm a better buyer for having my daily report always before me. I can see what I owe—what I have in the bank. I keep my outstanding accounts carefully checked and have had very few losses from bad debts.

My clerks are careful in adding up sales slips, because they know that each slip is later checked over mechanically with the Burroughs.

The Burroughs Machine is doing more than "pan" the ore of my figures for facts. It is putting organization and accuracy into my business and creating customer good-will.

There's a Burroughs Machine for every business. The Burroughs Company has 170 offices in the United States and Canada. Your banker or telephone book will give you the address of the nearest.

FIGURING AND BOOKKEEPING MACHINES PREVENT COSTLY ERRORS—SAVE VALUABLE TIME

PRICED AS LOW AS $125

Who won that $3000?

The Question on Half a Million Tongues

WHO won that $3000 for a better name than "flashlight"? From city, town and hamlet throughout the United States—from Central America, Cuba, Morocco and even China is heard the echo of this question. Everywhere interest is at high pitch and while half a million people wait, the Eveready organization is working day and night to find the winner and the winning word.

Never before has a contest for a new name met with such generous and enthusiastic response. Suggestions have poured in at the rate of 10,000 to 25,000 a day. On the last day of the contest 50,000 were received.

The Post Office at Long Island City was forced to call for help. Eveready automobile trucks were pressed into service to deliver contest mail. It took ten days after the close of the contest to finish opening the mail. It took six weeks to transfer to entry blanks the thousands of suggestions received in letters written to the company. It took one entire week to sort out all the names beginning with the letter "L."

Fifty *extra* employees have been necessary to handle the purely mechanical details such as opening mail, sorting, filing, etc.

College students were specially recruited to handle some of the more important routine. Salesmen from the Eveready organization were taken off the road to speed up the search for that $3000 word.

Scores of suggestions came from the boys on the border

Two days from here to Guantanamo, Cuba, but we got his suggestion in time

Now we are just as anxious to know who won that $3000 as you are; but we have simply been snowed under.

Up to the official date set for the close of the Eveready Contest (Nov. 7th, 1916) over 530,000 suggestions had been received and at this moment the judges have before them the 50,000 best suggestions from which the choice will be made.

To settle this question fairly we must ask for more time. On its settlement depends not only the fulfillment of our obligation to pay $3000 but a decision on that name which is best suited to our needs.

April 5th is the date now set for the award announcement. Watch your Eveready dealer's windows. The announcement of the prize winner will be made through our dealers as well as through the newspapers and magazines, because we can thus place the news before the greatest number of people with the least possible delay.

If the judges decide sooner, the announcement will not be held back. We are not going to keep half a million people waiting any longer than we can help.

50,000 Eveready dealers all over the United States and Canada are ready to flash the message when the judges decide.

Out in the sagebrush—80 miles from the nearest dealer—so we sent our western friend a contest blank.

(Continued from Page 30)

went to the Motor Trust Company. They deposited their respective checks on their own banks and signed the escrow agreement in duplicate. Then they separated, shortly before eleven o'clock.

John hurried from the Motor Trust Company to the machine shop, but Gordon was still absent. Kent restlessly attended to various routine business matters while he waited for his foster father's reappearance. Just after noon the bookkeeper, who had gone downtown ten minutes earlier to get the money for the weekly pay roll, rushed back to the office in great excitement. He told the junior partner the bank had refused to cash his check, because Gordon, at half past eleven, had drawn out all but a few dollars of the firm's balance of over eighteen thousand dollars.

Kent was startled and dumfounded. He could not imagine the specific reason for his partner's unprecedented surreptitious action; but he was sure it had a direct relation of some kind to Gordon's mistaken umbrage regarding the carburetor. John stood aghast after he heard the bookkeeper's story. The uncertified check for ten thousand dollars, which he himself had deposited in escrow with the Motor Trust Company at eleven o'clock, was made on the firm's account in the Wolverine National Bank. Over ten thousand dollars stood to the personal credit of the junior member on the partnership books, and Kent had drawn against this balance.

If now his escrow check should be presented at the firm's bank and repudiated, the Motor Trust Company would notify the automobile engineer at once. He would immediately stop payment on his own check for twenty-five thousand dollars. Gordon's act in drawing out all the partnership money, therefore, had imperiled and, at any minute, might invalidate Kent's contract with Walling. The consequences would be disastrous if the ten-thousand-dollar check should be protested.

John was half frantic. He sent the bookkeeper to scour the neighborhood for the veteran mechanic, who sometimes visited acquaintances in other machine shops near by. Kent himself started a frenzied search by telephone for his partner; but he could find no trace of the old Scotchman. Meantime precious time was passing. John expected the Wolverine National Bank to call him up any second and announce that his ten-thousand-dollar check had been presented for payment.

Shortly before half past twelve Gordon stalked into the little office. He was scowling blackly, but Kent hardly noticed his expression. With a cry of relief, mixed with acute anxiety, John rushed across the room.

"I've been looking for you everywhere! I want to explain to you about the carburetor, and ——"

"I know already what you've done!" Gordon snarled in a towering rage. "I met Henry Walling an hour ago. He showed me the contract you'd just signed. He said, too, you were going to take all your automobile specialties away from here and manufacture them in partnership with him. I tell you right now that you can't get 'em out of my shop any too quick to suit me!"

Kent tried to break in, but the old lion roared him silent.

"You needn't make any excuses! I understand why you're leaving me. Don't be a hypocrite and make believe you're sorry. I used to think you had high principles, but I've found you out to-day. You're like the majority of young fellows in these times—just a dollar worshiper. Get out! It will be good riddance for me. I never wanted your contraptions in my shop. Pack your stuff! Don't palaver! I know you can make more money with Walling."

The old master machinist half choked. He seemed beside himself with scornful fury.

"I despise a sneak!" he hissed through gritted teeth. "I might have had a little respect for you if you hadn't attempted to hide what you were up to. Why couldn't you come out honestly and tell me you had decided to cut loose from such an old fogy? It would have hurt to hear that, but not so much as it does to know you've been living a lie to me for months."

"I never thought ——" Kent began to protest frantically.

"I found out from Walling what you thought!" Gordon thunderously shut him off. "That I've been holding you back from getting rich! You thought I was a fossil—that I opposed having your specialties monopolize my shop because I had no faith in the automobile business. That wasn't it at all! You made me hate everything connected with motors, because your contraptions shoved me out of my place in the world! You never guessed the real reason I didn't seem to appreciate those profits from your inventions that you shared half and half with me. You think I'm sore now because I won't get anything out of the carburetor. I don't want money! You robbed me of more than you ever can pay back in dollars.

"Until you turned my old custom shop into a factory to make your specialties, most of the expert machine job work in Detroit was sent to George Gordon. I was known as the best independent mechanic in the city and I was proud of that reputation. But in the last few months my customers have been crowded out. I've had to refuse orders because your manufacturing required more and more room, and there was 'bigger money' in the specialties. Now I don't feel at home in the shop where I have worked thirty-two years! It's been so lately I couldn't bear to stay round the place.

"I sacrificed my pride because I thought as much of you as if you'd been my own son. I never would have told you how I felt about being shoved to one side in the old place if I hadn't found out your underhand deal to make more money by tying up with one of the worst rascals out of jail!"

Gordon's gray eyes blazed with contempt. Kent leaped to his partner and clutched his arm.

"Dad!" he cried. "You're wrong! I never intended to deceive you. I'll explain everything later. I haven't time now. Walling means to steal half of my carburetor. I just found out his scheme to-day. I've been looking for you ever since to tell you about him. I have trapped the fox in that contract he showed you! I tried to find you so you could advise me before I signed it; but I couldn't, and I had to act quickly. You endangered my whole plan when you drew that money from the bank. If my check for ten thousand dollars should be protested I'd be trapped, not Walling!"

Kent snatched the telephone and called the Engineering Works.

"Hello, Mr. Walling! This is John Kent. Can you come over to the shop right away? I'm straightening out my matters with Mr. Gordon and I need you here as a witness."

"I'll start this moment!" the engineer agreed eagerly.

Kent banged the receiver back on its hook and turned to his partner again.

"I called him away from his office so he can't get a message from the bank," he explained. "My check may be presented for payment any minute. Walling mustn't find out it isn't good before I spring my trap."

Kent had no time to recount details, but in the course of the next hundred seconds he sketched to dazed Gordon the reason why he had ordered the carburetor made at the Engineering Works. Then he summarized the plot to defraud him of his rights as sole inventor of the new device. He broke off abruptly as he caught sight of Walling through the front window.

"Here he comes, dad! Don't say a word until I give you the tip."

The engineer hurried in and shut the door. Kent quickly stepped behind him to bar the exit.

"Walling," he snapped, "you and I made an agreement this morning about my carburetor; but ——"

"That contract is perfectly legal," the engineer interrupted with instant suspicion. "I showed it to my attorney, and he assured me it is binding, though a little informal."

"I'm glad to know that!" Kent exclaimed. "I meant it to hold. I intend to stick by our agreement; but I didn't take time when we talked before to discuss certain details. So I'll explain now just what my plans are.

"This morning you referred to the fact that Mr. Gordon and myself hadn't been getting along very well lately. I've since learned that my partner and I have been working at cross-purposes. He misunderstood my reason for having you build the model. He has drawn wrong inferences, also, regarding my intentions with reference to the manufacture of the carburetor and my other specialties. On the other hand, I've misjudged him in several ways too."

Gordon leaned forward in strained eagerness as Kent continued to address the engineer.

"I told you, Walling, that I intended to take all my inventions out of the Gordon Machine Shop; but I didn't say where

FOR that logy, after-dinner time on Sunday afternoon—perchance you've eaten just a bit too much—

Wingfoot for an hour or so, and see the change it brings—*wingfoot* and fit yourself for next week's tasks.

The Goodyear Tire & Rubber Company guarantees Wingfoots to outwear any other rubber heel. A new pair free if yours do not.

Wingfoots in black, white and tan, for big folks and little folks—50 cents—put on by shoe dealers and repair men.

Lawson
Odorless Gas Heater

Has Revolutionized Gas Heating

The *Lawson* Odorless is the highest development in gas heaters. Its combustion chamber makes it odorless, economical and a greater producer of heat than gas stoves twice as large.

It radiates only pure, heated air—no smells, nothing "stuffy." Inside the perforated jacket is the combustion chamber, the "heart" of the Lawson, red hot and glowing, burning up all gases under high temperature.

This "red hot" heart spreads a cheering, ruddy glow and makes the Lawson the cosiest kind of heater.

Quickly takes the chill from cold, damp halls or supplies generous warmth to nursery, bath or spareroom. On the flat, open top you can heat water for baby's bath or for shaving. Thousands of "Lawson's" are giving satisfaction in homes everywhere.

Price, $5.00—at Dealers'

TEN DAYS' FREE TRIAL: If your dealer can't supply you send $5 and dealer's name. Satisfaction guaranteed or money back. Write for leaflet on Odorless Gas Stoves and for booklet on Lawson Water Heaters.

Dealers, Attention!

Open territory still obtainable. Write now and place order for fall. The Lawson Odorless is a quick seller and good money-maker. Prices and terms on request.

Lawson Manufacturing Co. of Pittsburgh

We are also makers of Lawson Water Heaters; over a million in use

I expected to do my manufacturing afterward. I realize now that it was unfair of me to crowd Mr. Gordon from his old quarters here, where he made his reputation as a mechanical expert. I've just come to full appreciation of his feelings. I comprehend how selfish and thoughtless I have been. The Gordon Machine Shop hereafter will be devoted exclusively to high-class work on tools and dies and designing, as it used to be. I'm going to pull all the manufacturing out."

Kent turned to the dumfounded Scotchman:

"Dad, I propose that our firm shall erect a factory building on the vacant lot next door to this old shop and do all our manufacturing there. In that way we'll have plenty of room in our present quarters for your expert custom work, and in the new plant for my automobile specialties. Of course we're to be partners in everything."

The veteran master machinist seemed spellbound. He opened his mouth slowly as if to speak; but Walling viciously broke in first:

"You can't make the carburetor in that new factory you intend to build! Gordon has nothing to do with that!"

"Why, yes, he has!" the inventor exclaimed in simulated surprise. "Dad owns half the carburetor, you know."

The old Scotchman looked as amazed as the engineer was astounded; but Gordon stood dumb while Walling shouted a question:

"What do you mean? You agreed to assign all the carburetor to our corporation."

Kent pulled his copy of the agreement from his pocket.

"You're mistaken about that," he remarked with provocative mildness. "I only contracted to assign 'all' *my* 'right, title and interest'—that is, my half of the carburetor. Six months ago, when I filed my patent application, I assigned the other half to Mr. Gordon. I told you, Walling, before we made our agreement that dad was entitled to half of everything I invented."

The fox saw the trap. He gnashed his sharp teeth in his fury.

"It's a fraud!" he snarled.

"I've prevented a fraud!" Kent corrected harshly. "Our contract is valid, Walling. Your own attorney advised you so. I notified you before you signed it that my partner had a right to half of any invention I might make. You were so unscrupulously greedy that you caught yourself.

"My contract is that I will assign all my rights in the carburetor to the corporation. I couldn't have bound Mr. Gordon if I had wanted to. He owns half of the invention. The law gives him the same right to manufacture as if he held the entire patent title." John grinned as he added: "Let me remind you of something here: I put into our agreement, Walling, a clause that provides 'Each party shall have exactly equal power with the other in the corporation management.' I notify you now that I shan't agree to the sale by the company of a single carburetor at the low price Mr. Gordon will make to the trade."

The engineer was frothing with rage.

"I'll fight you in court!" he yelled.

"The risk is too great," Kent retorted. "You have overlooked the provision in our contract that I am to draw a salary of five thousand dollars a year from the company, beginning within thirty days, while you'll get only one thousand dollars a year. I'm ready to go to work for the corporation on that basis.

"You put up twenty-five thousand of the thirty-five thousand dollars cash we have deposited together in escrow as subscriptions for the capital stock. The contract entitles me to receive for my services over twenty-nine thousand dollars in the time you'll get back a little less than six thousand of the money contributed to the corporation treasury. Our salaries have been agreed on. They must be paid whether the company manufactures many carburetors or only a few. You'd better give up the fight idea, Walling. Your methods won't appeal to the sympathy of the courts. I suggest that you compromise with me right now, while you have a chance."

"What do you mean?" the engineer barked.

"I'm satisfied to beat your crooked scheme to steal half of my carburetor. All I want in the contract we've made is the last clause—your acknowledgment, witnessed by Mr. Gordon, that you have no claim to my invention. Sign that statement separately, surrender every tracing and blue print you have, together with all the parts, tools and patterns of the model, and I'll let the corporation off from paying me that five-thousand-dollar salary for five years. I'll cancel this agreement and we'll both get our money back from the Motor Trust Company."

Walling drew a long breath. He did not parley a second.

"All right!" he accepted.

Walling sat down at Gordon's desk and snatched a sheet of paper. He copied the final paragraph of the contract in a minute; then signed his name. Kent read the release carefully and handed it over to his partner. He winked:

"Satisfied, dad?"

Gordon blinked like a man just coming out of a trance. He stared first at the trapped fox and then at John. Then his old eyes shone as brightly as a boy's.

"Satisfied!" the veteran machinist chortled aloud. "I'm just chock-full of satisfaction!"

Suddenly Gordon was alarmed by remembrance. He leaned over and whispered in his partner's ear:

"Jack! That ten-thousand-dollar check! I drew all the firm's money out of the bank just to prevent Walling from getting his claws on any of it. I knew he had a scheme of some kind to rob you. I was afraid the rascal would cash your check before I could warn you what a crook he was. I drew our entire balance to save your ten thousand dollars for you. But you said I'd got you into trouble. Maybe there isn't any damage done yet. I'll hustle over to the bank right off and redeposit the money I took out."

"Good old dad!" Kent choked. "Wait a minute."

He picked up the telephone and called the cashier of the firm's depository:

"John Kent talking. Has my check for ten thousand dollars to the Motor Trust Company been presented for payment yet? . . . Oh, it's just come in! Well, hold it, please. The deal for which it was given has been called off. I'll be over and see you in a few minutes."

Kent handed the telephone receiver to Walling:

"Call up your bank now and stop payment on your check too; then everything will be straightened out."

A Tribute

WHEN Julia Ward Howe died memorial services in her honor were held at San Francisco, and the local literary colony attended practically en masse to pay by their presence a tribute to the writer.

A municipal officer was asked to preside. Dressed in his long frock coat and his broad white tie, he advanced to the edge of the platform to launch the exercises and introduce the principal eulogist. He bowed low and spoke as follows:

"Your attendance here, ladies and gents, in such great numbers shows San Francisco's appreciation of good literature. This meeting is a great testimonial to the immortal author of Uncle Tom's Cabin—the late Julia Ward Howard!"

Dentists today follow their patients into their homes by means of prescriptions for daily use.

The serious meaning of sensitive gums

More teeth are lost through the loosening of the tissues that hold the teeth in place, than through decay

If at times your gums are sensitive when you brush them; if you have a loose or "tender" tooth; if certain foods set your teeth "on edge," *see your dentist immediately.*

These conditions that seem so negligible, usually portend one far more serious.

Your dentist will tell you that they are the early symptoms which, if not checked, may develop into a loosening of the teeth and their eventual loss. More permanent teeth are lost through this insidious loosening than through decay.

What dentists prescribe

Modern dentistry requires more for the treatment of such conditions than the application from time to time of medicinal agents by the dentist himself. Dentists today follow their patients into their homes by means of prescriptions for daily use. Not otherwise can persistent unhealthy conditions of the mouth be overcome.

At least twice daily must the patient himself supplement the work his dentist has done for him—by applications that will steadily tone up the condition of the gums.

Your tooth paste should be more than a cleanser

Ask your own dentist how you can do this at the same time that you cleanse your teeth daily. Ask him about Senreco Tooth Paste.

Senreco is more than a cleanser. It is a dentist's formula containing, in addition to cleansing properties, agents especially helpful for sensitive conditions of the gums. Because Senreco contains precisely the agents that dentists themselves apply to correct unhealthy conditions of the gums, many dentists use it at the chair, even though it is really a tooth paste intended for supplementary use.

Prevent the accumulation of tartar

As a cleanser, Senreco is wonderful. It polishes the surfaces of the teeth in a new and better way, and it *directly attacks the mucin film which leads to tartar.*

Try it. You will appreciate its medicinal qualities even more than its cleansing properties. It leaves a cool, clean, wholesome taste in the mouth. Notice after a few treatments the gradual strengthening of your gums to a wonderfully sound and healthy condition. You will delight in the brilliancy and whiteness of your teeth, and their cleanly freedom from the beginnings of tartar.

Senreco costs only 25c the large size tube, though it is probably the most expensive tooth paste prepared. You will find it at your druggist's or toilet counter. Get a tube today. Know for yourself what a healthy, cleanly feeling its use gives to the gums. Find out how much better for you is Senreco than any tooth paste that only cleanses.

Send 6c for a liberal sample

For six cents we will send you a sample tube of Senreco; enough to provide you with treatment twice daily for one week. Simply fill in your name and address on the coupon below, and mail it to us with six cents in stamps or coin. Address "Senreco," 1400 Masonic Temple, Cincinnati, Ohio.

Experimental Laboratory; Covington, Ky.

Senreco
REG. U.S. PAT. OFF.
THE TOOTHPASTE THAT REALLY CLEANS

A prominent dentist (name on request) writes:

"I want to call your attention to a case which will interest you as well as myself. A young man patient came to me in October last with very badly inflamed gums, no deposit around the necks to speak of. I scaled the roots thoroughly, and gave him a mouth wash (which had no effect). He came in this morning for a filling. I had forgotten about his gums until he called my attention to them. He says they are all right now and feel fine. He bought a tube of Senreco tooth paste, and says it wasn't a week before they were well. They have receded somewhat, but are in perfectly healthy condition. This is positive proof to me that you have *the* right preparation."

Another dentist (name on request) writes:

"What the busy dentist wants most is results. Your tooth paste, 'Senreco' combined with the usual oral treatment does give results. You have an ideal tooth paste."

Use Senreco twice daily.
See your dentist twice a year.

"Senreco"
1400 Masonic Temple, Cincinnati, Ohio

Please send me liberal sample tube of Senreco to provide me with treatments twice daily for one week. I enclose six cents for it.

JOHNS-MANVILLE

Service to you—through Public Utilities

Those who give you water, light, heat travel and communication—use Johns-Manville Products

THOSE great public servants who bring you light, heat, telephone, telegraph and make transportation possible, live by serving. Remarkable as they are in size and scope, they are even more impressive for the sense of tireless diligence they convey.

When you press the switch at 2 A. M., the light must respond. You lift the telephone receiver today or next year—Central is always there. You expect water when you turn on the faucet. Thousands of trains move daily over the rails so that you may take just one—occasionally—any time. Have you ever figured out why this is so? Why it can be?

In organization these companies approach perfection. In mechanical equipment they choose only the best. Every material they use must be dependable and so must the concern from whom they buy.

They buy Johns-Manville products. Conduit for underground wires, Wrappings for cables, Electrical Protective Devices, Cements for boiler furnaces, Insulations for steam pipes, Lagging and Packing for locomotives, Roofs for their buildings, Insulations for steel cars, Linings for smoke stacks, and a hundred other products—all of Johns-Manville.

* * *

What better recommendation to you for the quality, safety and dependability of all things that carry the surname Johns-Manville? What better testimonial could there be of the value of Johns-Manville Service to you personally?

HER DAIRY

(Continued from Page 6)

At seven I rose and with palpatating fingers dressed myself in my best evening Frock, which is a pale yellow. I put my hair up, and was just finished, when mother nocked. It was terrable.

I had to duck back into bed and crush everything. But she only looked in and said to try and behave for the next three hours, and went away.

At a quarter to eight I left the house in a clandestine manner by means of the cellar and the area steps, and on the pavment drew a long breath. I was free, and I had twelve dollars.

Act One went well, and no disturbence. Although Adrian started when he saw me. The yellow looked very well.

I had expected to sit back, sheltered by the curtains, and only visable from the stage. I have often read of this method. But there were no curtains. I therfor sat, turning a stoney profile to the audiance, and ignoreing it, as though it were not present, trusting to luck that no one I knew was there.

He saw me. More than that, he hardly took his eyes from the box wherein I sat. I am sure to that he had mentioned me to the company, for one and all they stared at me until I think they will know me the next time they see me.

I still think I would not have been recognized by the Familey had I not, in a very quiet seen, commenced to sneaze. I did this several times, and a lot of people looked anoyed, as though I sneazed because I liked to sneaze. And I looked back at them defiantly, and in so doing, encountered the gaze of my Maternel Parent.

Oh, Dear Dairy, that I could have died at that moment, and thus, when streched out a pathetic figure, with tubroses and other flowers, have compeled their pity. But alas, no. I sneazed again!

Mother was weged in, and I saw that my only hope was flight. I had not had more than between three and four dollars worth of the evening, but I glansed again and Sis was boreing holes into me with her eyes. Only Beresford knew nothing, and was trying to hold Sis's hand under her opera cloke. Any fool could tell that.

But, as I was about to rise and stand poized, as one may say, for departure, I caught Adrian's eyes, with a gleam in their deep depths. He was, at the moment, toying with the bowl of roses. He took one out, and while the leading lady was talking, he eged his way toward my box. There, standing very close, aparently by accident, he droped the rose into my lap.

Oh Dairy! Dairy!

I picked it up, and holding it close to me, I flew.

I am now in bed and rather chilley. Mother banged at the door some time ago, and at last went away, mutering.

I am afraid she is going to be petish.

JANUARY 22ND. Father came home this morning, and things are looking up. Mother of course tackeled him first thing, and when he came upstairs I expected an awful time. But my father is a reel Person, so he only sat down on the bed, and said:

"Well, chicken, so you're at it again!"

I had to smile, although my chin shook.

"You'd better turn me out and forget me," I said. "I was born for Trouble. My advice to the Familey is to get out from under. That's all."

"Oh, I don't know," he said. "It's pretty conveniant to have a Familey to drop on when the slump comes." He thumped himself on the chest. "A hundred and eighty pounds," he observed," just intended for little daughters to fall back on when other things fail."

"Father," I inquired, putting my hand in his, because I had been bearing my burdens alone, and my strength was ebing: "do you beleive in Love?"

"*Do* I!"

"But I mean, not the ordinery atachment between two married people. I mean love—the reel thing."

"I see! Why, of course I do."

"Did you ever read Pope, father?"

"Pope? Why I—probably, chicken. Why?"

"Then you know what he says: 'Curse on all laws but those which Love has made.'"

"Look here," he said, sudenly laying a hand on my brow. "I beleive you are feverish."

"Not feverish, but in trouble," I explained. And so I told him the story, not saying much of my deep Passion for Adrian, but merly that I had formed an atachment for him which would persist during life. Although I had never yet exchanged a word with him.

Father listened and said it was indeed a sad story, and that he knew my deep nature, and that I would be true to the End. But he refused to give me any money, except enough to pay back Hannah and Carter Brooks, saying:

"Your mother does not wish you to go to the theater again, and who are we to go against her wishes? And anyhow, maybe if you met this fellow and talked to him, you would find him a disapointment. Many a pretty girl I have seen in my time, who didn't pan out acording to specifications when I finaly met her."

At this revalation of my beloved father's true self, I was almost stuned. It is evadent that I do not inherit my being true as steal from him. Nor from my mother, who is like steal in hardness but not in being true to anything but Social Position.

As I record this awfull day, dear Dairy, there comes again into my mind the thought that *I do not belong here.* I am not like them. I do not even resemble them in features. And, if I belonged to them, would they not treat me with more consideration and less disipline? Who, in the Familey, has my noze?

It is all well enough for Hannah to observe that I was a pretty baby with fat cheaks. May not Hannah herself, for some hiden reason, have brought me here, takeing away the reel I to perhaps languish unseen and "waste my sweetness on the dessert air?" But that way lies madness. Life must be made the best of as it is, and not as it might or indeed ought to be.

Father promised before he left that I was not to be scolded, as I felt far from well, and was drinking water about every minute.

"I just want to lie here and think about things," I said, when he was going. "I seem to have so many thoughts. And father ——"

"Yes, chicken."

"If I need any help to carry out a plan I have, will you give it to me, or will I have to go to totle strangers?"

"Good gracious, Bab!" he exclaimed. "Come to me, of course."

"And you'll do what you're told?"

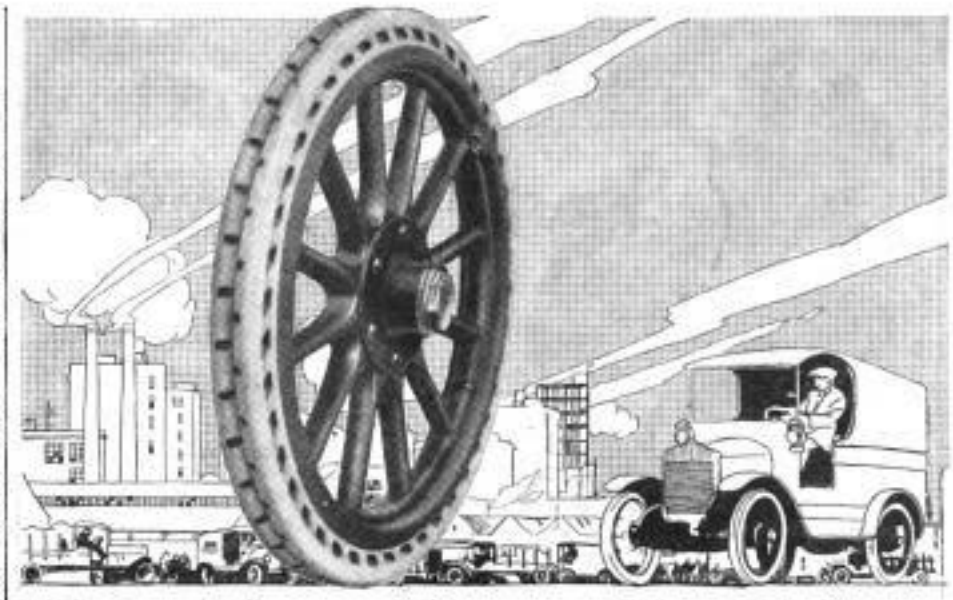
He looked out into the hall to see if mother was near. Then, dear Dairy, he turned to me and said:

"I always have, Bab. I guess I'll run true to form."

JANUARY 23RD. Much better today. Out and around. Familey (mother and Sis) very dignafied and nothing much to say. Evadently have promised father to restrain themselves. Father rushed and not comeing home to dinner.

Beresford on edge of proposle. Sis very jumpy.

LATER: Jane Raleigh is home for her couzin's wedding! Is comeing over. We shall take a walk, as I have much to tell her.



6 P.M. What an afternoon! How shall I write it? This is a Milestone in my Life.

I have met him at last. Nay, more. I have been in his dressing room, conversing as though acustomed to such things all my life. I have conceled under the mattress a reel photograph of him, beneath which he has written Yours always, Adrian Egleston."

I am writing in bed, as the room is chilley—or I am—and by putting out my hand I can touch his pictured likeness.

Jane came around for me this afternoon, and mother consented to a walk. I did not have a chance to take Sis's pink hat, as she keeps her door locked now when not in her room. Which is rediculous, because I am not her tipe, and her things do not suit me very well anyhow. And I have never borowed anything but gloves and handkercheifs, except Muidie's dress and the hat.

She had, however, not locked her bathroom, and finding a bunch of violets in the washbowl I put them on. It does not hurt violets to wear them, and anyhow I knew Carter Brooks had sent them and she ought to wear only Beresford's flowers if she means to marry him.

Motz Tires Cause No Delays

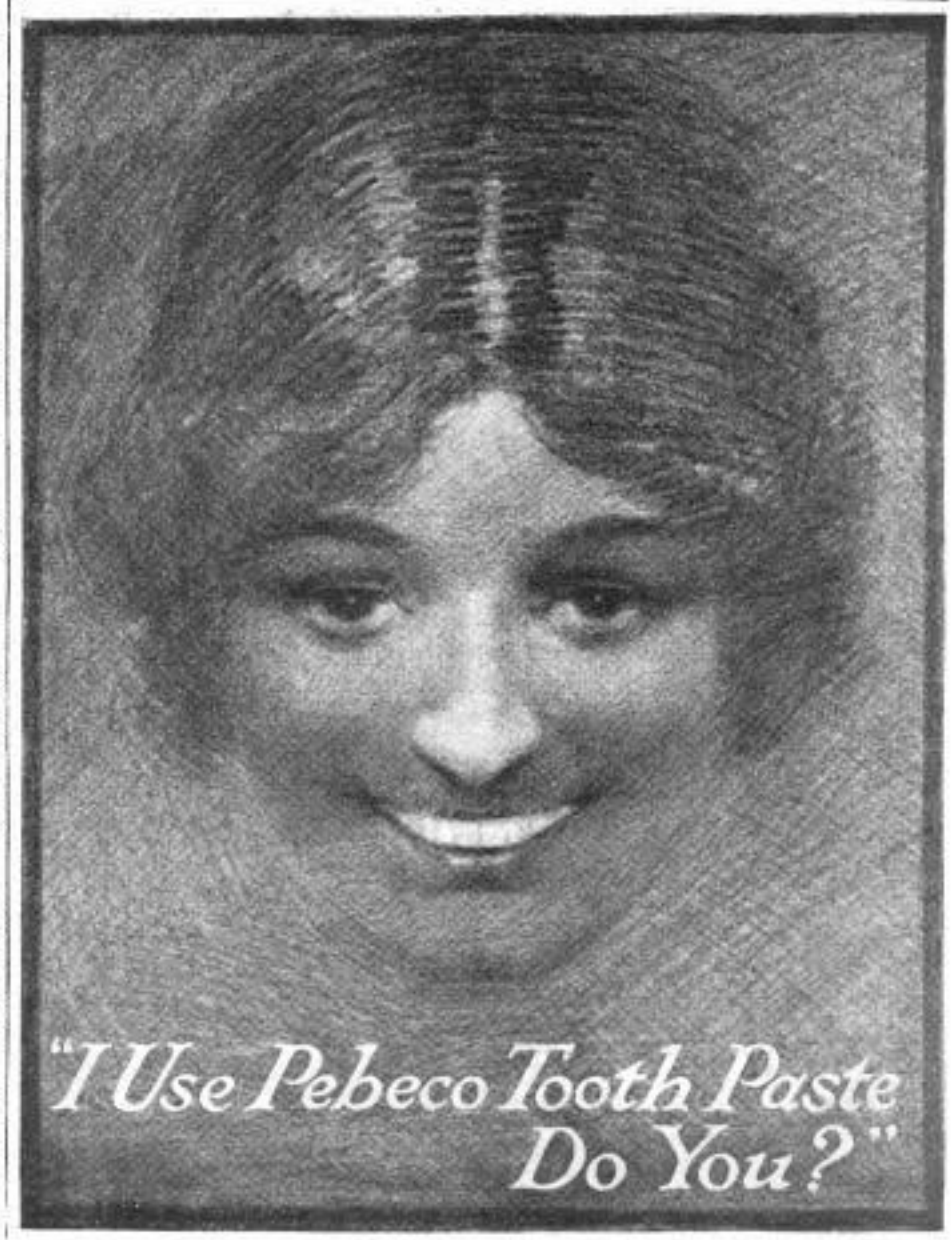
To approximate the resilience of high-grade pneumatics, while retaining the trouble-proof qualities of solid rubber construction—such is the plan behind the making of the high-efficiency Goodyear Motz Cushion Tire.

Most light trucks—up to a ton and a half capacity—are used in delivery service.

Here speed is essential.

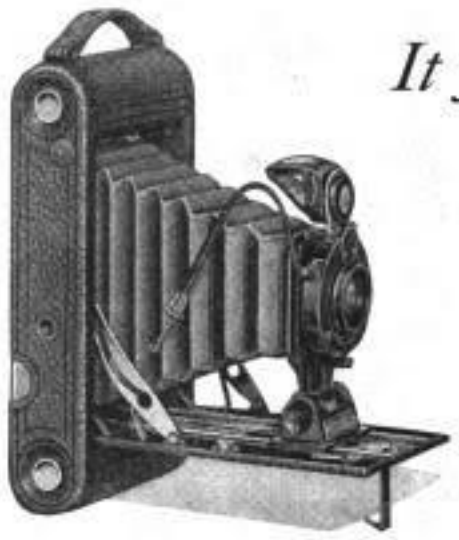
But *certainty* and freedom from trouble are just as important as speed.

And Motz Tires deliver *both* speed and certainty.



Moreover these tires are economical, averaging better than 10,000 miles—with records up to 35,000.

And they save power cost.



These facts account for the phenomenal increase in the use of this tire—practically *two* Motz Tires in use now for every *one* a year ago.

Your Pride in Your Bathroom

demands it be kept clean, and really the toilet bowl is the simplest part of your bathroom to keep clean and sanitary, if you use

Sani-Flush

a cleaning preparation to be used for toilet bowls only. It not only removes the stain from the parts you can see, but it does get right down to the hidden trap where no brush can reach, cleaning it and keeping it clean. You don't have to dip water. Just sprinkle a little *Sani-Flush* in the bowl every few days.

25 Cents a Can

Sani-Flush is a necessity wherever there's a toilet. It cannot harm the bowl or the plumbing. Almost every dealer has it. If you do not find it readily, write

THE HYGIENIC PRODUCTS CO.
168 Walnut St., Canton, Ohio

Jane at once remarked that I looked changed.

"Naturaly," I said, in a *blase* maner.

"If I didn't know you, Bab," she observed, "I would say that you are rouged."

I became very stiff and distant at that. For Jane, although my best friend, had no right to be suspisious of me.

"How do I look changed?" I demanded.

"I don't know. You—Bab, I beleive you are up to some mischeif!"

"Mischeif?"

"You don't need to pretend to me," she went on, looking into my very soul. "I have eyes. You're not decked out this way for *me*."

I had meant to tell her nothing, but spying just then a man ahead who walked like Adrian, I was startled. I cluched her arm and closed my eyes.

"Bab!" she said.

The man turned, and I saw it was not he. I breathed again. But Jane was watching me, and I spoke out of an overflowing heart.

"For a moment I thought—Jane, I have met *the one* at last."

"Barbara!" she said, and stoped dead. "Is it any one I know?"

"He is an Actor."

"Ye gods!" said Jane, in a tence voice. "What a tradgedy!"

"Tradgedy indeed," I was compeled to admit. "Jane, my Heart is breaking. I am not alowed to see him. It is all off, forever."

"Darling!" said Jane. "You are trembling all over. Hold on to me. Do they disaprove?"

"I am never to see him again. Never."

The biterness of it all overcame me. My eyes sufused with tears.

But I told her, in broken accents, of my determination to stick to him, no matter what. I might never be Mrs. Adrian Egleston, but ——"

"Adrian Egleston!" she cried, in amazement. "Why *Barbara*, you lucky Thing!"

So, finding her fuller of simpathy than usual, I violated my Vow of Silense, and told her all.

And, to prove the truth of what I said, I showed her the sachet over my heart containing his rose.

"It's perfectly wonderfull," Jane said, in an awed tone. "You beat anything I've ever known for adventures. You are the tipe men like, for one thing. But there is one thing I could not stand, in your place—haveing to know that he is making love to the heroine every evening and twice on Wednesdays and—Bab, this is *Wednesday!*"

I glansed at my wrist watch. It was but too o'clock. Instantly, dear Dairy, I became conscious of a dual going on within me, between love and duty. Should I do as instructed and see him no more, thus crushing my inclination under the iron heal of resolution? Or should I cast my Parents to the winds, and go?

Which?

At last I desided to leave it to Jane. I observed:

"I'm forbiden to try to see him. But I darsay, if you bought some theater tickets and did not say what the play was, and we went and it hapened to be his, it would not be my fault, would it?"

I cannot recall her reply, or much more, except that I waited in a Pharmasy, and Jane went out, and came back and took me by the arm.

"We're going to the matinee, Bab," she said. "I'll not tell you which one, because it's to be a surprize." She squeazed my arm. "First row," she whispered.

I shall draw a Vale over my feelings. Jane bought some chocolates to take along, but I could eat none. I was thirsty, but not hungry. And my cold was pretty bad, to.

So we went in, and the curtain went up. When Adrian saw me, in the front row, he smiled although in the midst of a serious speach about the world oweing him a liveing. And Jane was terrably excited.

"Isn't he the handsomest Thing!" she said. "And oh, Bab, I can see that he adores you. He is acting for you. All the rest of the people mean nothing to him. He sees but you."

Well, I had not told her that we had not yet met, and she said I could do nothing less than send him a note.

"You ought to tell him that you are true, in spite of everything," she said.

If I had not decieved Jane things would be better. But she was set on my sending the note. So at last I wrote one on my visiting card, holding it so she could not read it. Jane is my best friend and I am devoted to her, but she has no scrupels about reading what is not meant for her. I said:

"Dear Mr. Egleston: I think the Play is perfectly wonderfull. And you are perfectly splendid in it. It is perfectly terrable that it is going to stop.

(Signed) The girl of the rose.

I know that this seems bold. But I did not feel bold, Dear Dairy. It was such a letter as any one might read, and contained nothing compromizing. Still, I darsay I should not have written it. But "out of the fulness of the Heart the mouth speaketh."

I was shakeing so much that I could not give it to the usher. But Jane did. However, I had sealed it up in an envelop.

Now comes the reel surprize, dear Dairy. For the usher came down and said Mr. Egleston hoped I would go back and see him after the act was over. I think a paller must have come over me, and Jane said:

"Bab! Do you dare?"

I said yes, I dared, but that I would like a glass of water. I seemed to be thirsty all the time. So she got it, and I recovered my *savoir fair*, and stopped shakeing.

I supose Jane expected to go along, but I refrained from asking her. She then said:

"Try to remember everything he says, Bab. I am just crazy about it."

Ah, dear Dairy, how can I write how I felt when being led to him. The entire seen is engraved on my soul. I, with my very heart in my eyes, in spite of my eforts to seem cool and collected. He, in front of his mirror, drawing in the lines of starvation around his mouth for the next seen, while on his poor feet a *valet* put the ragid shoes of Act II!

He rose when I entered, and took me by the hand.

"Well!" he said. "At last!"

He did not seem to mind the *valet*, who he treated like a chair or table. And he held my hand and looked deep into my eyes.

Ah, dear Dairy, men may come and men may go in my life, but never again will I know such ecstacy as at that moment.

"Sit down," he said. "Little lady of the rose—but it's violets today, isn't it? And so you like the play?"

I was by that time somwhat calmer, but glad to sit down, oweing to my knees feeling queer.

"I think it is magnifacent," I said.

"I wish there were more like you," he observed. "Just a moment, I have to make a change here. No need to go out. There's a screan for that very purpose."

He went behind the screan, and the man handed him a raged shirt over the top of it, while I sat in a chair and dreamed. What I reflected, would the School say if it but knew! I felt no remorce. I was there, and beyond the screan, changing into the garments of penury, was the only member of the Other Sex I had ever felt I could truly care for.

Dear Dairy, I am tired and my head aches. I cannot write it all. He was perfectly respectfull, and only his eyes showed his true feelings. The woman who is the Adventuress in the play came to the Door, but he motioned her away with a waive of the hand. And at last it was over, and he was asking me to come again soon, and if I would care to have one of his pictures.

I am very sleepy tonight, but I cannot close this record of a w-o-n-d-e-r-f-u-l d-a-y — without ——

JANUARY 24TH. Cold worse.

Not hearing from Carter Brooks I telefoned him just now. He is sore about Beresford and said he would not come to the house. So I have asked him to meet me in the park, and said that there were only to more days, this being Thursday.

LATER: I have seen Carter, and he has a fine plan. If only father will do it.

Carter has a fine idea to help the play. He says the Theme is that the world owes Adrian a liveing, and that the way to do is to put that strongly before the people.

"Supose;" he said, "that this fellow would go to some big factery, and demand work. Not ask for it. Demand it. He could pretend to be starveing and say: "the world owes me a liveing, and I intend to have it."

"But supose they were sorry for him and gave it to him?" I observed.

"Tut,child," he said. "That would have to be all fixed up first. It ought to be aranged that he not only be refused, but what's more, that he'll be thrown out. He'll have to cut

Wearing Durable-DURHAM is Like Money-in-the-Bank

YES, siree, Bob! When the low-cost-of-wearing-Durable-DURHAM flashes on the screen, the high-cost-of-living sneaks out the back door. And, indeed, it *should!* For, as far as we know, Durable-DURHAM is the only complete, *guaranteed* line of *good* hosiery for the entire family selling as low as 15, 19, 25 and 35c the pair.

Only by being situated in the heart of the cotton country, by expert manufacturing in enormous quantities, with rigid factory inspection, is it possible to offer such wonderful value as you get in

Durable DURHAM Hosiery

FOR MEN, WOMEN AND CHILDREN

Made Strongest Where the Wear Is Hardest

Thousands and thousands of substantial American families who formerly paid higher prices for their hosiery have swung around to the common-sense, economical habit of wearing smooth, comfortable, fine-fitting Durable-DURHAM, "The National Footwear."

Romping, marble-shooting school-kids; mothers who like to do most of their own housework; practical American fathers, brothers and sisters—all wear Durable-DURHAM, get heaps of satisfaction in the wearing, and put the difference in the bank. Uncle Sam's soldiers and sailors, too, wear Durable-DURHAM.

The guarantee-ticket means just what it says: If for any reason you are not entirely satisfied with your Durable-DURHAM, take them back to the man who sold them to you, and he'll give you a new pair, or your money back—just like that. Pull on a pair of Durable-DURHAM.

A PROPHECY FULFILLED

Ten years ago the scientist saw in his prophetic crystal, a ***greater*** motive power—a power so far superior that it would supersede all the motive forces then in general use.

He foresaw Electricity the Giant harnessed to serve every need of man.

It drives the humble but necessary knitting needle. It drives the California, impressive among super-dreadnaughts. It drives the Detroit Electric, equally impressive among motor cars.

It is the ***standard*** in power. It is ***the*** smooth power, ***the*** clean power, ***the*** silent power, ***the*** cheap power, ***the one power*** changeless in quality.

Only such a perfect power united with the finest coach-building art enables the attainment of such a car as the modern Detroit Electric—the supreme expression in motordom of all-year comfort and service.

A single charge in the batteries gives you 80 to 90 miles of trouble-free travel. Beyond charging it needs but the rarest attention. It is dependability itself—and available for service 365 days a year. Prices range from $1775 to $2375.

up a lot, d'you see, so they'll throw him out. And we'll have reporters there, so the story can get around. You get it, don't you? Your friend, in order to prove that the idea of the Play is right, goes out for a job, and proves that he cannot demand Laber and get it." He stoped and spoke with excitement: "Is he a reel sport? Would he stand being arested? Because that would cinch it."

But here I drew a line. I would not subject him to such humilliation. I would not have him arested. And at last Carter gave in.

"But you get the Idea," he said. "There'll be the deuce of a Row, and it's good for a half collum on the first page of the evening papers. Result, a jamb that night at the performence, and a new lease of life for the Play. Egleston comes on, bruized and battered, and perhaps with a limp. The labor unions take up the matter—it's a knock out. I'd charge a thousand dollars for that idea if I were selling it."

"Bruized!" I exclaimed. "Realy bruized or painted on?"

He glared at me impatiently.

"Now see here, Bab," he said. "I'm doing this for you. You've got to play up. And if your young man won't stand a bang in the eye, for instanse, to earn his Bread and Butter, he's not worth saveing."

"Who are you going to get to—to throw him out?" I asked, in a faltering tone.

He stoped and stared at me.

"I like that!" he said. "It's not my Play that's failing, is it? Go and tell him the Skeme, and then let his maniger work it out. And tell him who I am, and that I have a lot of Ideas, but this is the only one I'm giveing away."

We had arived at the house by that time and I invited him to come in. But he only glansed biterly at the Windows and observed that they had taken in the mat with Welcome on it, as far as he was concerned. And went away.

Although we have never had a mat with Welcome on it.

Dear Dairy, I wonder if father would do it? He is gentle and kind-hearted, and it would be paneful to him. But to who else can I turn in my extremity?

I have but one hope. My father is like me. He can be coaxed and if kindly treated will do anything. But if aproached in the wrong way, or asked to do somthing against his principals, he becomes a Roaring Lion.

He would never be bully-ed into giveing a Man work, even so touching a Personallity as Adrian's.

LATER: I meant to ask father tonight, but he has just heard of Beresford and is in a terrable temper. He says Sis can't marry him, because he is sure there are plenty of things he could be doing in England, if not actualy fighting.

"He could probably run a bus, and release some one who can fight," he shouted. "Or he could at least do an honest day's work with his hands. Don't let me see him, that's all."

"Do I understand that you forbid him the house?" Leila asked, in a cold furey.

"Just keep him out of my sight," father snaped. "I supose I can't keep him from swilling tea while I am away doing my part to help the Allies ——"

"Oh, rot!" said Sis, in a scornfull maner. "While you help your bank account, you mean. I don't object to that, father, but for Heaven's sake don't put it on altruistic grounds."

She went upstairs then and banged her door, and mother merly set her lips and said nothing. But when Beresford called, later, Tanney had to tell him the Familey was out.

Were it not for our afections, and the necessity for getting married, so there would be an increase in the Population, how happy we could all be!

LATER: I have seen father.

It was a paneful evening, with Sis shut away in her room, and father cuting the ends off cigars in a viscious maner. Mother was *non est*, and had I not had my memories, it would have been a Sickning Time.

I sat very still and waited until father softened, which he usualy does, like ice cream, all at once and all over. I sat perfectly still in a large chair, and except for an ocasional sneaze, was quiet.

Only once did my parent adress me in an hour, when he said:

"What the devil's making you sneaze so?"

"My noze, I think, sir," I said meekly.

"Humph!" he said. "It's rather a small noze to be making such a racket."

I was cut to the heart, dear Dairy. One of my dearest dreams has always been a delicate noze, slightly arched and long enough to be truly aristocratic. Not realy acqualine but on the verge. I *hate* my little noze—hate it—hate it—*hate it*.

"Father!" I said, rising and on the point of tears. "How can you! To taunt me with what is not my own fault, but partly heredatary and partly carelessness. For if you had pinched it in infansy it would have been a good noze, and not a pug. And ——"

"Good gracious!" he exclaimed. "Why, Bab, I never meant to insult your noze. As a matter of fact, it's a good noze. It's exactly the sort of noze you ought to have. Why, what in the world would you do with a Roman noze?"

I have not been feeling very well, dear Dairy, and so I sudenly began to weap.

"Why, chicken!" said my father. And made me sit down on his knee. "Don't tell me that my bit of sunshine is behind a clowd!"

"Behind a noze," I said, feebly.

So he said he liked my noze, even although somwhat swolen, and he kissed it, and told me I was a little fool, and at last I saw he was about ready to be tackeled. So I observed:

"Father, will you do me a faver?"

"Sure," he said. "How much do you need? Busness is pretty good now, and I've about landed the new order for shells for the English war department. I—supose we make it fifty! Although we'd better keep it a Secret between we to."

I drew myself up, although tempted. But what was fifty dollars to doing somthing for Adrian? A mere bagatell.

"Father," I said, "do you know Miss Everett, my English teacher?"

He remembered the name.

"Would you be willing to do her a great faver?" I demanded intencely.

"What sort of a faver?"

"Her couzin has written a play. She is very fond of her couzin, and anxious to have him suceed. And it is a lovely play."

He held me off and stared at me.

"So *that* is what you were doing in that box alone!" he exclaimed. "You incomprehensable child! Why didn't you tell your mother?"

"Mother does not always understand," I said, in a low voice. "I thought, by buying a Box, I would do my part to help Miss Everett's couzin's play suceed. And as a result I was draged home, and shamefully treated in the most mortafying maner. But I am acustomed to brutalaty."

"Oh, come now," he said. "I wouldn't go as far as that, chicken. Well, I won't finanse the play, but short of that I'll do what I can."

However, he was not so agreable when I told him Carter Brooks' plan. He delivered a firm no.

"Although," he said, "sombody ought to do it, and show the falasy of the Play. In the first place, the world doesn't owe the fellow a liveing, unless he will hustel around and make it. In the second place an employer has a right to turn away a man he doesn't want. No one can force capitle to employ laber."

"Well," I said, as long as Laber talks and makes a lot of noise, and Capitle is to dignafied to say anything, most people are going to side with Laber."

He gased at me.

"Right!" he said. "You've put your finger on it, in true femanine fashion."

"Then why won't you throw out this man when he comes to you for Work? He intends to forse you to employ him."

"Oh, he does, does he?" said father, in a feirce voice. "Well, let him come. I can stand up for my principals, to. I'll throw him out, all right."

Dear Dairy, the battle is over and I have won. I am very happy. How true it is that strategy will do more than violance!

We have aranged it all. Adrian is to go to the mill, dressed like a decayed Gentleman, and father will refuse to give him work. I have said nothing about violance, leaving that to arange itself.

I must see Adrian and his maniger. Carter has promised to tell some reporters that there may be a story at the mill on Saturday morning. I am to excited to sleep.

Feel horid. Forbiden to go out this morning.

JANUARY 25TH. Beresford was here to lunch and he and mother and Sis had a long talk. He says he has kept it a secret because he did not want his Busness known. But he is here to place a shell order for the English war department.

"Well," Leila said, "I can hardly wait to tell father and see him curl up."

"No, no," said Beresford, hastaly. "Realy you must alow me—I must inform him myself. I am sure you can see why. This is a thing for men to settle. Besides, it is a delicate matter. Mr. Archibald is trying to get the Order, and our New York office, if I am willing, is ready to place it with him."

"Well!" said Leila, in a thunderstruck tone. "If you British don't beat anything for keeping your own council!"

I could see that he had her hand under the table. It was sickning.

Jane came to see me after lunch. The wedding was that night, and I had to sit through silver vegatable dishes, and after-dinner coffee sets and plates and a grand piano and a set of gold vazes and a cabushon saphire and the bridesmaid's clothes and the wedding supper and heaven knows what. But at last she said:

"You dear thing—how weary and wan you look!"

I closed my eyes.

"But you don't intend to give him up, do you?"

"Look at me!" I said, in imperious tones. "Do I look like one who would give him up, because of Familey objections?"

"How brave you are!" she observed.

"Bab, I am green with envy. When I think of the way he looked at you, and the tones of his voice when he made love to that—that creature, I am posatively *shaken*."

We sat in somber silense. Then she said:

"I darsay he detests the heroine, doesn't he?"

"He tolarates her," I said, with a shrug.

More silense. I rang for Hannah to bring some ice water. We were in my *boudoir*.

"I saw him yesterday," said Jane, when Hannah had gone.

"Jane!"

"In the park. He was with the woman that plays the Adventuress. Ugly old thing."

I drew a long breath of releif. For I knew that the Adventuress was at least thirty and perhaps more. Besides being both wicked and cruel, and not at all femanine.

Hannah brought the ice-water and then came in the most madening way and put her hand on my Forehead.

"I've done nothing but bring you ice-water for too days," she said. "Your head's hot. I think you need a musterd foot bath and to go to bed."

"Hannah," Jane said, in her loftyest fashion, "Miss Barbara is woried, not ill. And please close the door when you go out."

Which was her way of telling Hannah to go. Hannah glared at her.

"If you take my advice, Miss Jane," she said. "You'll keep away from Miss Barbara."

And she went out, slaming the door.

"Well!" gasped Jane. "Such impertanence. Old servant or not, she ought to have her mouth slaped."

Well, I told Jane the plan and she was perfectly crazy about it. I had a headache, but she helped me into my street things, and got Sis's rose hat for me while Sis was at the telefone. Then we went out.

First we telaphoned Carter Brooks, and he said tomorrow morning would do, and he'd give a couple of reporters the word to hang around father's office at the mill. He said to have Adrian there at ten o'clock.

"Are you sure your father will do it?" he asked. "We don't want a flivver you know."

"He's making a principal of it," I said. "When he makes a principal of a thing, he does it."

"Good for father!" Carter said. "Tell him not to be too gentle. And tell your actor-friend to make a lot of fuss. The more the better. I'll see the policeman at the mill, and he'll probably take him up. But we'll get him out for the matinee. And watch the evening papers."

It was then that a terrable thought struck me. What if Adrian considered it beneath his profession to advertize, even if indirectly? What if he prefered the failure of Miss Everett's couzin's play to a bruize on the eye? What, in short, if he refused?

Dear Dairy, I was stupified. I knew not which way to turn. For Men are not like Women, who are dependible and anxious to get along, and will sacrifise anything for Success. No, men are likely to turn on the ones they love best, if the smallest Things do not suit them, such as cold soup, or sleaves to long from the shirt-maker, or plans made

which they have not been consulted about beforhand.

"Darling!" said Jane, as I turned away, "you look *stricken!*"

"My head aches," I said, with a weary gesture toward my forehead. It did ache, for that matter. It is acheing now, dear Dairy.

However, I had begun my task and must go through with it. Abandoning Jane at a corner, in spite of her calling me cruel and even sneeking, I went to Adrian's hotel, which I had learned of during my *seance* in his room, while he was changing his garments behind a screan, as it was marked on a dressing case.

It was then five o'clock.

How nervous I felt as I sent up my name to his chamber! Oh, dear Dairy, to think that it was but five hours ago that I sat and waited, while people who guessed not the inner trepadation of my heart past and repast, and glansed at me and at Leila's pink hat above.

At last he came. My heart beat thunderously, as he aproached, strideing along in that familiar walk, swinging his strong and tender arms. And I? I beheld him comeing, and could think of not a word to say.

"Well!" he said, pausing in front of me. "I knew I was going to be lucky today. Friday is my best day."

"I was born on Friday," I said. I could think of nothing else.

"Didn't I say it was my lucky day? But you mustn't sit here. What do you say to a cup of tea in the restarant?"

How grown up and like a *debutante* I felt, dear Dairy, going to have tea as if I had it every day at School, with a handsome actor across! Although somwhat uneasy also, owing to the posibility of the Familey comeing in. But it did not and I had a truly happy hour, not at all spoiled by looking out the window and seeing Jane going by, with her eyes poping out, and walking very slowly so I would invite her to come in.

Which I did not.

Dear Dairy, *he will do it.* At first he did not understand, and looked astounded. But when I told him of Carter being in the advertizing business, and father owning a large mill, and that there would be reporters and so on, he became thoughtfull.

"It's realy incredably clever," he said. "And if it's pulled off right it ought to be a stampede. But I'd like to see Mr. Brooks. We can't have it fail, you know." He leaned over the table. "It's straight goods, is it, Miss—er—Barbara? There's nothing foney about it?"

"Foney!" I said, drawing back. "Certainly not."

He kept on leaning over the table.

"I wonder," he said, "what makes you so interested in the Play?"

Oh, Dairy, Dairy!

And just then I looked up, and the Adventuress was stareing in the door at me with the *meanest* look on her face.

I draw a Vale over the remainder of our happy hour. Suffice it to say that he considers me exactly the tipe he finds most atractive, and that he does not consider my noze to short. We had a long dispute about this. He thinks I am wrong and says I am not an acquiline tipe. He says I am romantic and of a loveing disposition. Also somwhat reckless, and he gave me good advice about doing what my Familey consider for my good, at least until I come out.

But our talk was all to short, for a fat man with three rings on came in, and sat down with us, and ordered a whiskey and soda. My blood turned cold, for fear some one I knew would come in and see me sitting there in a drinking party.

And my blood was right to turn cold. For, just as he had told the maniger about the arangement I had made, and the maniger said "Bully" and raised his glass to drink to me I looked across and there was mother's aunt, old Susan Paget, sitting near, with the most awfull face I ever saw!

I colapsed in my chair.

Dear Dairy, I only remember saying, "Well, remember, ten o'clock. And dress up like a gentleman in hard luck," and his saying: "Well, I hope I'm a gentleman, and the hard luck's no joke," and then I went away.

And now, dear Dairy, I am in bed, and every time the telefone rings I have a chill. And in between times I drink ice-water and sneaze. How terrable a thing is love.

LATER: I can hardly write. Switzerland is a setled thing. Father is not home tonight and I cannot apeal to him. Susan said I was drinking to, and mother is haveing the vibrater used on her spine. If I felt better I would run away.

JANUARY 26TH. How can I write what has happened? It is to terrable.

Beresford went at ten o'clock to ask for Leila, and did not send in his card for fear father would refuse to see him. And father thought, from his saying that he had come to ask for somthing, and so on, that it was Adrian, and threw him out. He ordered him out first, and Beresford refused to go, and they had words, and then there was a fight. The reporters got it, and it is in all the papers. Hannah has just brought one in. It is headed "Manufacturer assaults Peer." Leila is in bed, and the doctor is with her.

LATER: Adrian has disspeared. The maniger has just called up, and with shakeing knees I went to the telefone. Adrian went to the mill a little after ten, and has not been seen since.

It is in vane I protest that he has not eloped with me. It is almost time now for the matinee and no Adrian. What shall I do?

SATURDAY, 11 P.M. Dear Dairy, I have the meazles. I am all broken out, and look horible. But what is a sickness of the body compared to the agoney of my mind? Oh, dear Dairy, to think of what has happened since last I saw your stainless Pages!

What is a sickness to a broken heart? And to a heart broken while trying to help another who did not deserve to be helped. But if he decieved me, he has paid for it, and did until he was rescude at ten o'clock tonight.

I have been given a sleeping medacine, and until it takes affect I shall write out the tradgedy of this day, omiting nothing. The trained nurse is asleep on a cot, and her cap is hanging on the foot of the bed.

I have tried it on, dear Dairy, and it is very becomeing. If they insist on Switzerland I think I shall run away and be a trained nurse. It is easy work, although sleeping on a cot is not always comfortible. But at least a trained nurse leads her own life and is not bully-ed by her Familey. And more, she does good constantly.

I feel tonight that I should like to do good, and help the sick, and perhaps go to the Front. I know a lot of college men in the American Ambulence.

I shall never go on the stage, dear Dairy. I know now its decietfullness and visisitudes. My heart has bled until it can bleed no more, as a result of a theatricle Adonis. I am through with the theater forever.

I shall begin at the beginning. I left off where Adrian had disapeared.

Although feeling very strange, and looking a queer red color in my mirror, I rose and atired myself. I felt that somthing had slipped, and I must find Adrian. (It is strange with what coldness I write that once beloved name.)

While dressing I percieved that my chest and arms were covered with small red dots, but I had no time to think of myself. I sliped downstairs and outside the drawing room I heard mother conversing in a loud and angry tone with a visitor. I glansed in, and ye gods!

It was the Adventuress.

Drawing somwhat back, I listened. Oh, Dairy, what a revalation!

"But I *must* see her," she was saying. "Time is flying. In a half hour the performence begins, and—he cannot be found."

"I can't understand," mother said, in a stiff maner. "What can my daughter Barbara know about him?"

The Adventuress snifed. "Humph!" she said. "She knows, all right. And I'd like to see her in a hurrey, if she is in the house."

"Certainly she is in the house," said mother.

"*Are you sure of that?* Because I have every reason to beleive she has run away with him. She has been hanging around him all week, and only yesterday afternoon I found them together. She had some sort of a Skeme, he said afterwards, and he wrinkeled a coat under his mattress last night. He said it was to look as if he had slept in it. I know nothing further of your daughter's skeme. But I do know he went out to meet her. He has not been seen since. His maniger has hunted for to hours."

"Just a moment," said mother, in a fridgid tone. "Am I to understand that this—this Mr. Egleston is ——"

"He is my husband."

Ah, dear Dairy, that I might then and there have passed away. But I did not. I stood there, with my heart crushed, until I felt strong enough to escape. Then I fled, like a Gilty Soul. It was gastly.

On the doorstep I met Jane. She gased at me strangely when she saw my face, and then cluched me by the arm.

"Bab!" she cried. "What on the earth is the matter with your complexion?"

But I was desparate.

"Let me go!" I said. "Only lend me two dollars for a taxi and let me go. Somthing horible has happened."

She gave me ninty cents, which was all she had, and I rushed down the street, followed by her peircing gaze.

Although realizing that my life, at least the part of it pertaining to sentament, was over, I knew that, single or married, I must find him. I could not bare to think that I, in my desire to help, had ruined Miss Everett's couzin's play. Luckaly I got a taxi at the corner, and I ordered it to drive to the mill. I sank back, bathed in hot persparation, and on consulting my bracelet watch found I had but twenty five minutes until the curtain went up.

I must find him, but where and how! I confess for a moment that I doubted my own father, who can be very feirce on ocasion. What if, madened by his mistake about Beresford, he had, on being aproached by Adrian, been driven to violance? What if, in my endeaver to help one who was unworthy, I had led my poor paternal parent into crime?

"Hell is paved with good intentions."

SAMUEL JOHNSTON.

On driveing madly into the mill yard, I sudenly remembered that it was Saturday and a half holaday. The mill was going, but the offices were closed. Father, then, was imured in the safety of his Club, and could not be reached except by pay telefone. And the taxi was now ninty cents.

I got out, and paid the man. I felt very dizy and queer, and was very thirsty, so I went to the hydrent in the yard and got a drink of water. I did not as yet suspect meazles, but laid it all to my agoney of mind.

Haveing thus refreshed myself, I looked about, and saw the yard policeman, a new one who did not know me, as I am away at school most of the time, and the Familey is not expected to visit the mill, because of dirt and posible accidents.

I aproached him, however, and he stood still and stared at me.

"Officer," I said, in my most dignafied tones. "I am looking for a—for a gentleman who came here this morning to look for work."

"There was about two hundered lined up here this morning, Miss," he said. "Which one would it be, now?"

How my heart sank!

"About what time would he be comeing?" he said. "Things have been kind of mixed-up around here today, oweing to a little trouble this morning. But perhaps I'll remember him."

But, although Adrian is of an unusual tipe, I felt that I could not describe him, besides haveing a terrable headache. So I asked if he would lend me carfare, which he did with a strange look.

"You're not feeling sick, Miss, are you?" he said. But I could not stay to converce, as it was then time for the curtain to go up, and still no Adrian.

I had but one refuge in mind, Carter Brooks, and to him I fled on the wings of misery in the street car. I burst into his advertizing office like a furey.

"Where is he?" I demanded. "Where have you and your plotting hiden him?"

"Who? Beresford?" he asked in a placid maner. "He is at his hotel, I beleive, putting beefstake on a bad eye. Beleive me, Bab ——"

"Beresford!" I cried, in scorn and wrechedness. "What is he to me? Or his eye either? I refer to Mr. Egleston. It is time for the curtain to go up now, and unless he has by this time returned, there can be no performence."

"Look here," Carter said sudenly, "you look awfuly queer, Bab. Your face ——"

I stamped my foot.

"What does my face matter?" I demanded. "I no longer care for him, but I have ruined Miss Everett's couzin's play unless he turns up. Am I to be sent to Switzerland with that on my soul?"

"Switzerland!" he said slowly. "Why, Bab, they're not going to do that, are they? I—I don't want you so far away."

Dear Dairy, I am unsuspisious by nature, beleiving all mankind to be my friends until proven otherwise. But there was a gloating look in Carter Brooks' eyes as they turned on me.

"Carter!" I said, "you know where he is and you will not tell me. You *wish* to ruin him."

I was about to put my hand on his arm, but he drew away.

"Look here," he said. "I'll tell you somthing, but please keep back. Because you look like smallpox to me. I was at the mill this morning. I do not know anything about your actor-friend. He's probably only been run over or somthing. But I saw Beresford going in, and I—well, I sugested that he'd better walk in on your father or he wouldn't get in. It worked, Bab. *How it did work!* He went in and said he had come to ask your father for somthing, and your father blew up by saying that he knew about it, but that the world only owed a liveing to the man who would hustel for it, and that he would not be forsed to take any one he did not want.

"And in too minutes Beresford hit him, and got a responce. It was a million dollars worth."

So he babbled on. But what were his words to me?

Dear Dairy, I gave no thought to the smallpox he had mentioned, although fatle to the complexion. Or to the fight at the mill. I heard only Adrian's posible tradgic fate. Sudenly I colapsed, and asked for a drink of water feeling horible, very wobbley and unable to keep my knees from bending.

And the next thing I remember is father taking me home, and Adrian's fate still a deep mystery, and remaining such, while I had a warm sponge to bring out the rest of the rash, folowed by a sleep—it being meazles and not smallpox.

Oh, Dear Dairy, what a story I learned when haveing wakened and feeling better, my father came tonight and talked to me from the doorway, not being alowed in.

Adrian had gone to the mill, and father, haveing thrown Beresford out and asserted his principals, had not thrown him out, *but had given him a job in the mill.* And the policeman had given him no chance to escape, which he atempted. He was draged to the shell plant and there locked in, because of spies. The plant is under milatary guard.

And there he had been compeled to drag a wheelbarrow back and forth, containing charcoal for a small furnase, for hours!

Even when Carter found him he could not be releaced, as father was in hideing from reporters, and would not go to the telefone or see callers.

He labored until ten P. M., while the theater remained dark, and people got their money back.

I have ruined him. I have also ruined Miss Everett's couzin.

* * *

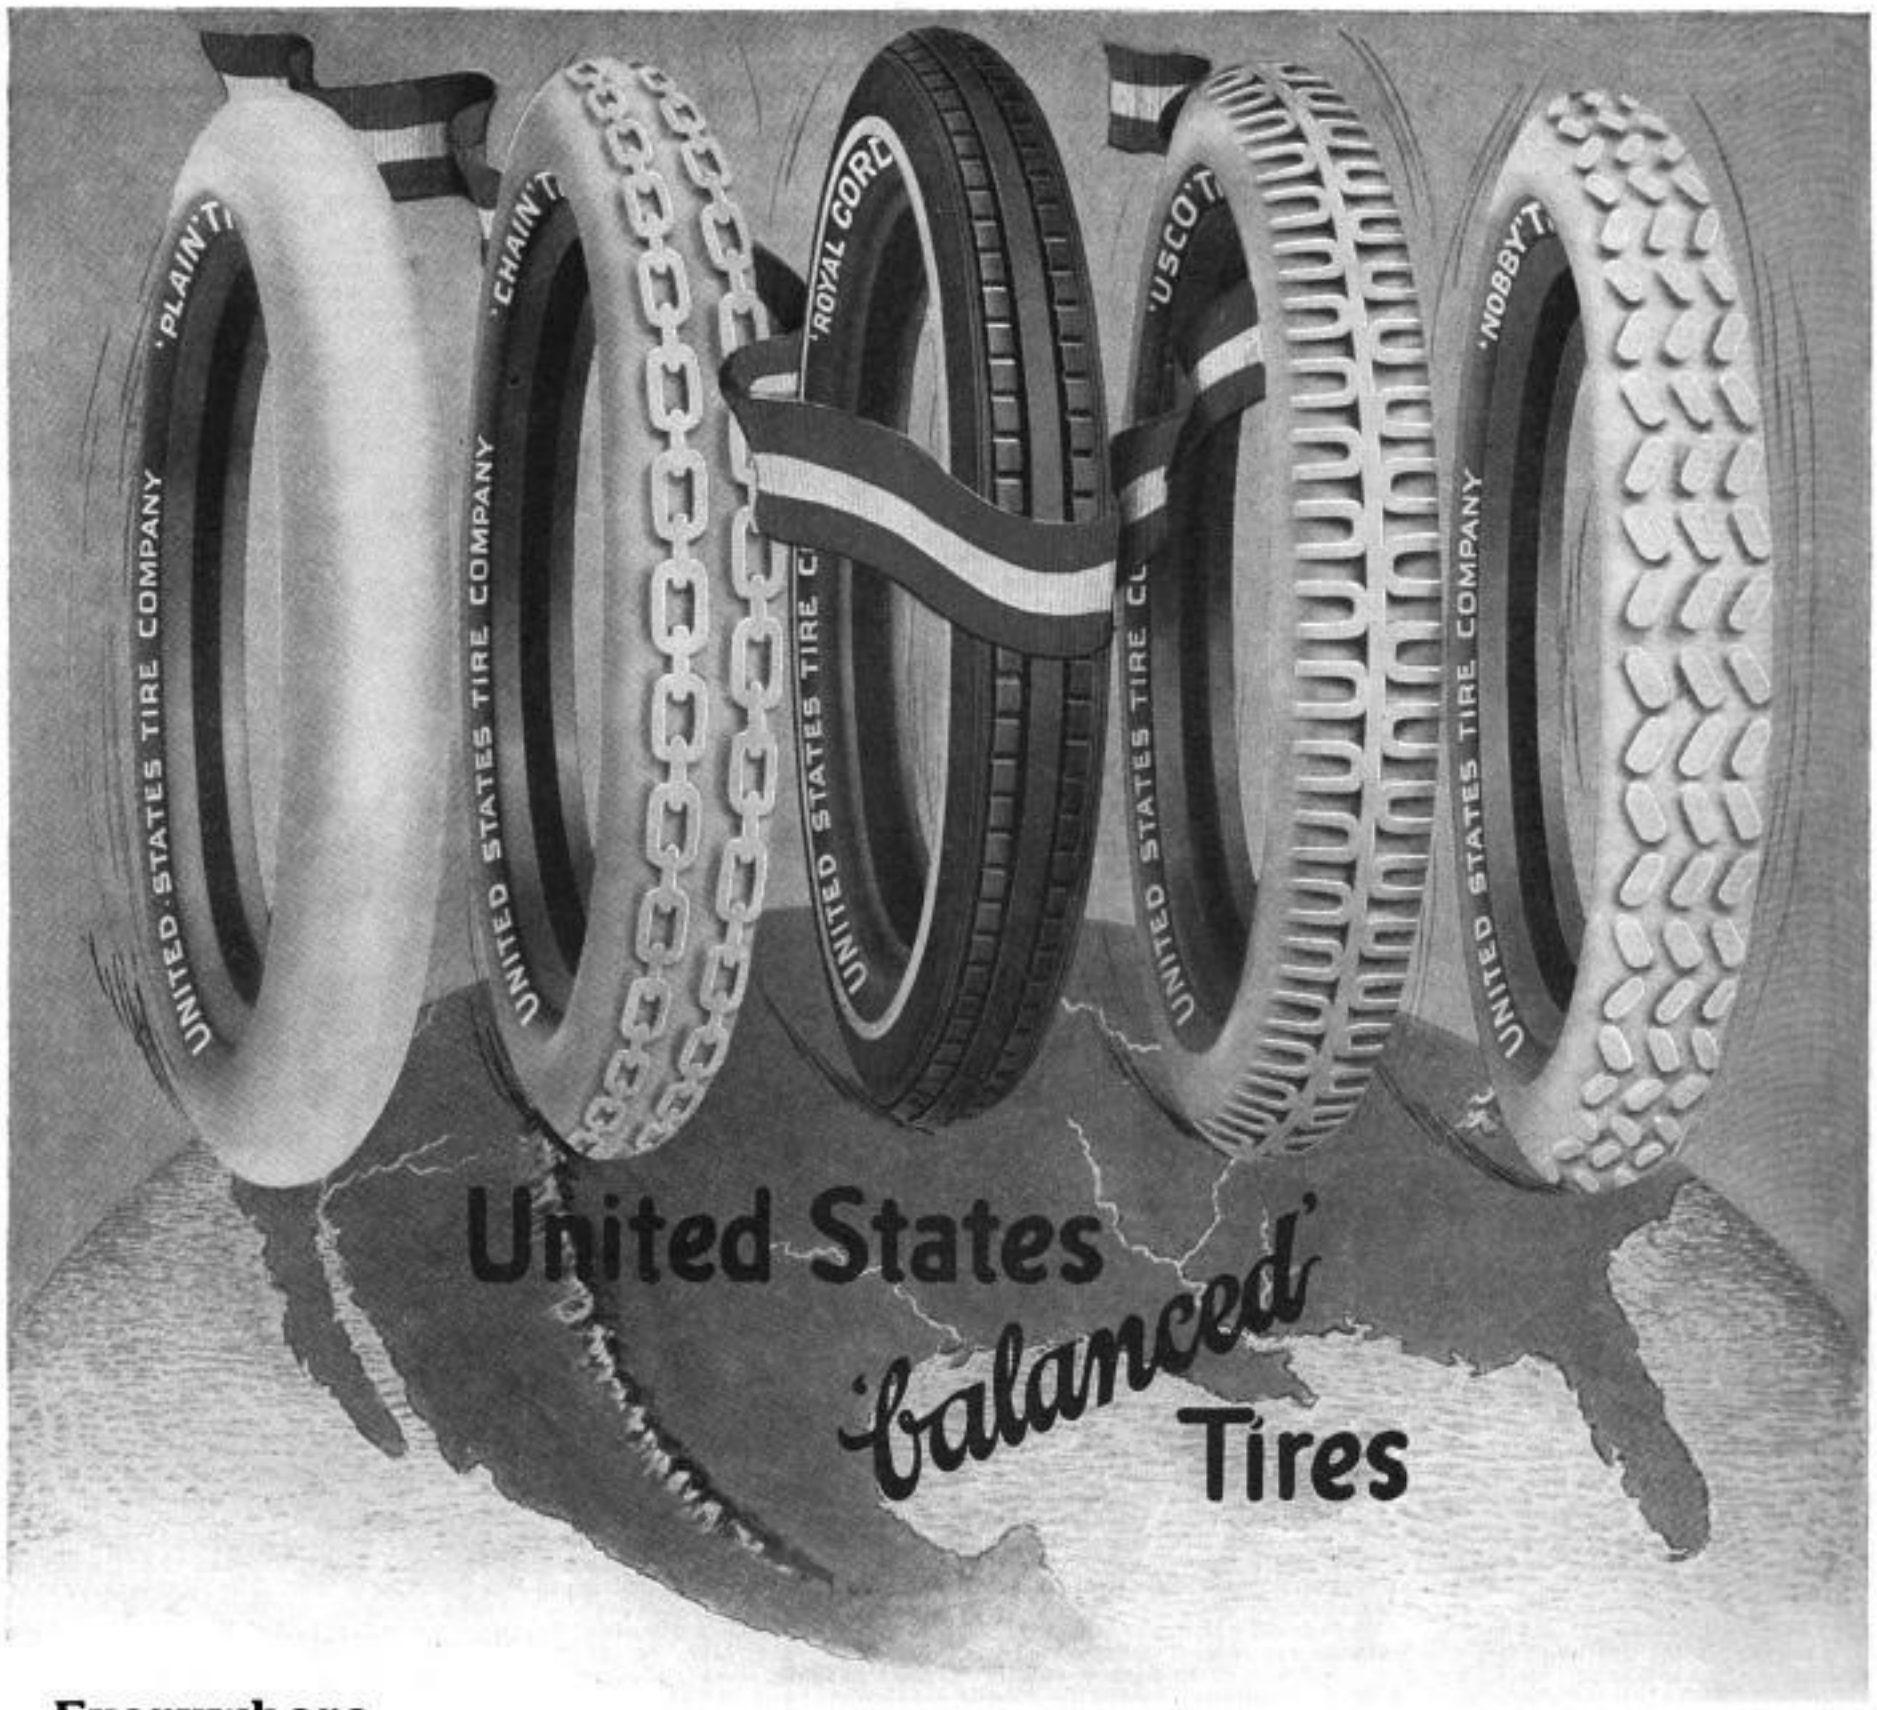
The nurse is still asleep. I think I will enter a hospitle. My career is ended, my life is blasted.

I reach under the mattress and draw out the picture of him who today I have ruined, compeling him to do manuel laber for hours, although unaccustomed to it. He is a great actor, and I beleive has a future. But my love for him is dead. Dear Dairy, he decieved me, and that is one thing I cannot forgive.

So now I sit here among my pilows, while the nurse sleeps, and I reflect about many Things. But one speach rings in my ears over and over.

Carter Brooks, on learning about Switzerland, said it in a strange maner, looking at me with inscrutible eyes.

"Switzerland! Why, Bab—I don't want you to go so far away."



What did he mean by it?

* * *

Dear Dairy, you will have to be burned, I darsay. Perhaps it is as well. I have p o r e d out my h-e-a-r-t ——

Everywhere

Everywhere—throughout the length and breadth of the United States—you'll find United States Tires doing day-in and day-out consistent service.

On little cars and big cars—over good boulevards and rutty, rocky country lanes—over city pavements and uncertain sandy roads—up-hill and downdale—giving the sort of service YOU have always wanted—long mileage and low mileage cost.

There are five types of United States Tires. Ask your dealer which one is best suited for your car and needs.

Good dealers everywhere sell them—wise motorists everywhere use them—that's the story of United States Tires.

'Nobby' 'Chain' 'Usco' 'Royal Cord' 'Plain'

A tire for every motoring need of price and use.

BUG HUNTERS OF INDUSTRY

(Concluded from Page 14)

contracts whenever material is bought, and they must be adhered to by the sellers.

When material is received at the factory the inspection force compares it with the specifications. A shipment of gun rod, for instance, is wanted for making fine screws for apparatus with delicate clearances, like an adding machine. A ton of this gun rod may be worked up into several million screws. But a few pieces of rod that did not meet the requirements of diameter, which may be within one-thousandth of an inch, if included in that ton of material and sent through the plant would make all kinds of trouble and expense. So the inspectors probably go over each separate piece of such a shipment and gauge it from end to end with calipers.

The next item may be a carload of castings. This is not so delicate a job of inspection, but it calls for just as much vigilance. The material must be examined for flaws and weighed to see that it is not running too heavy to the piece. Foundrymen have been known to make their own bills larger by shipping castings overweight. Such parts later on may add to the difficulties and costs of factory departments. So now at the door of almost every factory stands the chief inspector, like a policeman, ready to exclude trouble.

Products have become so complex lately, and promise to become so much more so, that he is absolutely necessary. It has not always been thus.

Once the average factory took most of its materials on snap judgment and guesswork, and the sellers furnished materials in about the same way. When the inspector appeared at the factory door and began sorting right from wrong, with his specifications and tests, there was a loud yell from the fellow whose stuff did not pass. He charged partiality on the part of the inspector, who told the dissatisfied producer to go away and learn something about his own business. But by and by the manufacturers found themselves facing about the same problems. One factory's finished product is raw material for some other factory. They were all in the same boat, so very sensibly they got together to talk matters over. And out of this phase of inspection has grown some of the finest constructive coöperation that exists in business to-day, with exchanges of information and interrelations between industries for the solution of common problems on a common basis.

Quite simple tests of raw material and tools will often decrease the percentage of defective goods produced. A large shoe concern equipped all its foremen with pocket microscopes of good magnifying power, and what they saw through them was most useful in improving the product. An operator on a stitching machine would have trouble with breaking thread. Under the glass the needle often showed a rough eye, and thus was revealed a poor lot of needles. Or a defect might be disclosed in the thread. No fancy finish served to hide defective leather when the foreman could see the grain through a microscope, and what looked like careless work on the part of an operator, viewed just from appearances, was often found to be due to dull tools, when they were examined under the microscope.

Human Inspectors the Best

In his relation to the factory, too, after materials have been started through the works, the inspector is a policeman. His job is to watch all the other fellows, even the boss if necessary, and hold everybody up to standards that must be enforced regardless of whose job or feelings are affected. Nowadays the inspector is often a department in himself. He has a central office with testing apparatus and master gauges, and when an order for so many thousand parts of a certain product is given to the factory he may require that each thousandth one be brought to his office for comparison with the standard. He has his assistants who follow work through the factory, checking up shortcomings of materials and men. A piece of defective work cannot be moved until they have made an investigation and tied a special tag on it.

The fruit growers of this country discovered that such police authority was necessary for a good product when, some years ago, they began packing red apples and bright oranges in fancy ways for fancy prices. At the outset each grower undertook to pack his own fruit according to the standard. But it was found that not one grower in a hundred could see worm holes in his own apples or scale on his own oranges. So the central-packing-house system came into existence, with an expert to pack and an inspector to watch the fruit during growth.

Without this system of impartiality it is well-nigh impossible to maintain a good standard in packing soil produce.

The factory inspector must also have human qualities, for the mere faultfinder doesn't get very far, no matter what his authority. An ideal factory inspector should be both a technical expert and a human being. He has to be an adviser and co-worker as well as a sleuth. He must be interested in helping all departments attain a high percentage of perfect production. Incidentally, he is not an easy man to find.

In a big electrical works there was an epidemic of damage to costly apparatus in the assembling department. Trouble seemed to be due to sheer carelessness on the part of workmen, and to stop it the chief inspector, who was a martinet, imposed heavy penalties. That didn't help matters a bit. Workmen grew sullen and silent, shielded one another and smuggled away damaged stuff. Another inspector was appointed. He was a finer kind of human being. His first act was to abolish all penalties and to make the damage problem a get-together proposition. When anything came through in bad shape he went out among the men, reassured them and made inquiries as to how the mishap had occurred. His attitude brought out all the facts that had been suppressed before and showed that carelessness was only a small factor in the problem. It was easier to eliminate even carelessness after all the facts were known, for then all the resources of the department could be brought to bear on the culprit, whereas before he had been scolded, fined and left to lonely self-improvement.

What Was Found in the Dump

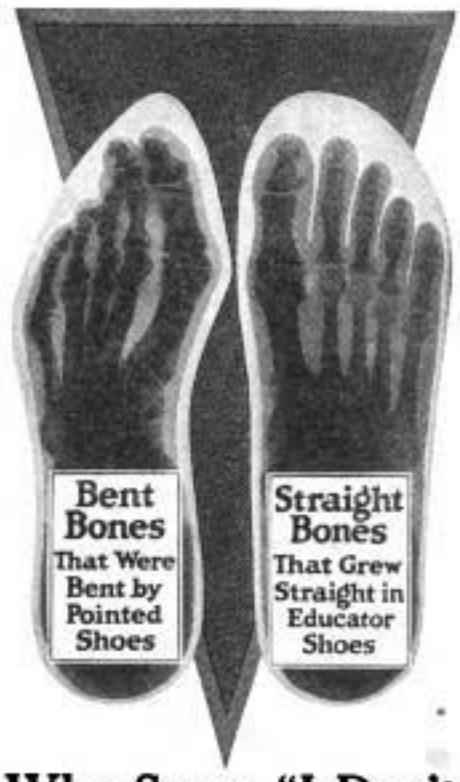
Some concerns still charge each worker with the material that he spoils, making no effort to find out if the system is wrong. To add to this injustice, either the spoiled work is sold outright and the proceeds pocketed by the company, or the material in it is actually built into product, after the workman has paid for it, and put on the market.

How far such a system falls short of touching the real problem is shown in a story told by a machine-shop foreman. One of his best mechanics began spoiling shafts during grinding, and he turned out so many cripples that he asked to be put on some other work. He thought that he had lost his nerve. The foreman went back to the machine and watched the operator grind a shaft. Halfway through the shaft departed from true. Right next to that machine was another one, just like it, run by a less skillful man, who was turning out perfect work. The foreman could not account for the error and called an engineer, who was puzzled too. They went over both machines, making a regular doctor's diagnosis by eliminating every factor that was right. Still nothing was found which seemed to be wrong. Finally the trouble was located in a slight difference in the consistence of the grinding compound, a most obscure trouble. When that was set right the mechanic got his nerve back.

If inspection is blindly severe with its penalties, a factory can develop a vast underworld system for eluding them and covering up its mistakes. A new inspector of the human kind took charge of a plant where the other sort had ruled for years. His first step was to make a search of the boxes in which sweepings were carried out of the different departments. More than three thousand pieces of damaged stuff were found the first night—materials and tools that had been spoiled and smuggled out to the dump to escape the notice of the inspector. This had been going on for years, with heavy losses to the company. The new inspector handed to each foreman a list of stuff traced to his department, and this was posted where workers could see it and could compare their records with those of other departments. That started a competition of the old, familiar horse-race kind. Next night there was less dumped material, and in a month the salvage had been reduced practically to nothing.

Even when the trouble was remedied, however, the inspector kept up his nightly sifting of dirt boxes. For it was found that dumped material would turn up suddenly, and its appearance always gave a clew to something wrong in the factory. Several hundred spoiled parts would come from a single department. Investigation showed that this department was being driven at too high pressure or that something was wrong with equipment.

A similar plan was adopted in an automobile factory in order to reduce the number of defective parts returned by owners of cars. In one month ten transmission countershafts were returned by owners for replacement as defective. The engineering staff studied those shafts to find out which had been defective when they left the factory and which had been damaged by careless owners. Then the facts were posted in the department that worked the countershafts. Ten cripples against an output of one thousand cars gave that department a percentage of one per cent of cripples. The percentage of each department was posted, so all could compare their respective efficiency, in plain figures. It was as clear as a baseball score and led to the elimination of cripples almost immediately.



Cripples are often charged to the carelessness of the men, when they are really due to defective equipment. They found that out some years ago in the shoe factories, when fashions in women's shoes turned to light-colored fancy fabrics. Immediately there was heavy loss from soiled shoes. They came to the treeing room marred by wax, cement, oil, dirt. No system of penalties did much good, and for a while the makers of bleaches and whiteners did a good business in their preparations for taking out stains. Finally the manufacturers tackled the difficulty in a broader way. Rooms were especially fitted up for making white and fancy shoes. Benches were covered with white cloth. Walls and ceilings were painted white. Floors were kept scrupulously clean, and even the machinery was enameled white. This furnished a background against which dirt was quickly spotted and eliminated. It was astonishing how quickly oil and dirt were wiped off a white-enameled machine. Then the shoes themselves were protected by cloth and paper covers, and operators were required to wear clean aprons and cotton gloves. After that the fancy shoes went through with only a trifling percentage of cripples.

How the System Helps the Worker

When downright carelessness and incompetence have been traced to a worker, and spoiled work is plainly his fault, under the new system of inspection he is given another chance. In the first place it finds his mistakes and helps him try to correct them. It keeps his mistakes separate from those of other workers and gives him the benefit of all doubts when machinery or methods are wrong. Then, when it is clear that he is to blame, it studies him personally and usually discovers that he is a good man in the wrong place. Somebody has put him at fine, exacting work, when he is really fitted for rough, heavy tasks, or vice versa.

If the inspection system is intelligent it tries to keep the man on at a more congenial job. One of the biggest problems in industry to-day is that of shifting human misfits round until square holes have square pegs, and round holes have round pegs, and every worker finds himself doing something in which he is interested and at which he can excel. A big job! It cannot be done in a day or a year. But it is being done piecemeal right now, as the necessity for doing it is recognized. Nothing helps more in the appraisal of workers than an intelligent inspection system for running down cripples in the factory.

Editor's Note—This is the first of a series of articles by James H. Collins. The second will appear in an early issue.

Who Says: "I Don't Want Healthy Feet"?

SURELY, nobody in his senses would *say* that. And yet, thousands of people *show* they don't want healthy feet, by wearing narrow, bone-bending shoes, which cause corns, bunions, flat-foot and ingrown nails.

Show that *you* want healthy feet by getting into Educators now—the roomy, comfortable shoes built by experts to "let the feet grow as they should."

Made for
MEN, WOMEN, CHILDREN

Get Educators for your whole family today. For children they mean life-long protection from foot-troubles. For you they mean relief or prevention of all foot ills.

But don't fail to look for the word EDUCATOR branded on the sole. It guarantees the correct orthopædic Educator shape.

"Bent Bones Make Frantic Feet" is a free booklet of important information about the feet by orthopædic scientists. Send for it now.

"Two Weeks' Addressing Now Done In One Day"

This Same Speed and Accuracy Await You

"It gives me great pleasure to say that the DIREX-ALL put in our office four years ago has been a most wonderful help in our work. Bills that used to require two weeks to address are now addressed in a day. Our system requires two stubs on each bill and duplicate names and addresses on each. By the use of the machine this is easily done without the possibility of error and very quickly. I regard it as a very efficient machine and almost indispensable where a list goes up into the thousands as ours does."

(Signed) JAMES BURTON,
Supt. Fort Scott Water Works,
Fort Scott, Kansas

With a DIREX-ALL you can save time, labor and expense in your mailing, listing and billing departments just as surely as does the Fort Scott Water Works.

And, in addition, the DIREX-ALL will insure an accuracy of work that will add to the efficiency of your office, and the effectiveness of your service.

Whether your mailing list is large or small, or whether your listing and billing is light or heavy, there is a DIREX-ALL for your particular needs—one that combines the threefold convenience of a mailing, listing *and* billing machine.

The DIREX-ALL is the modern addressing machine with typewriter ribbon principle and one-piece metal plates. Filing the imprinting plates gives you a complete index system that takes the place of cards. Operation so simple that a boy or girl can do it all with wonderful accuracy and dispatch—*guaranteed!*

An interesting book, "Doing the Day's Work Better," pictures and describes the particular DIREX-ALL made for you, no matter what your line of business. Free for the asking. Write to our nearest office today.

Royal Chair Co., 1100 Chicago St., Sturgis, Mich.

—and Realize Your Dream of Comfort!

No matter what your occupation during the day, you need a good, comfortable chair in which to relax and rest at night.

Such a chair is now offered you—a chair of *remarkable* comfort, yet beautiful and artistic as well. And by prompt action you can have it at a saving of $8.00.

Royal Easy Chairs

"PUSH THE BUTTON—BACK RECLINES"

Royals are famously known as the world's easiest easy chair. When you want to lean back and get extra comfy in this chair, just push the button in the right chair-arm—the back reclines!—goes back to any desired angle, locking until released by another finger pressure.

And a leg rest, out of sight when not used, completes your dream of comfort. Complete relaxation—solace for every bone, nerve, muscle—rest, rejuvenation unfindable in anything but a Royal. Durably made and upholstered; push button device silent, out of the way, trouble-proof.

Take Advantage of This Liberal Offer

To further introduce Royals, we offer the two beautiful models shown herewith at a reduction of $7.00. But take the coupon to your Royal dealer, and he will allow you $1.00 for it, applying same on price of either chair illustrated. That means a saving of $8.00. Think of it! Clip coupon now!

No. 1 Special—A big, comfortable easy chair, luxuriously overstuffed, artistic—covered in genuine Spanish Leather, mahogany finish. Push Button, Leg Rest, Brass Vent, Brass Casters. Regular $37.50 value. Introductory price, after deducting $1 Coupon, $19.38. ($3 extra Denver and West.)

No. 2 Special—Also, deep den Chair—in Fumed Oak, Spanish Leatherette cover only. Fitted with Push Button, Leg Rest, and Brass Casters. Reg. value $27.75. Introductory price, after deducting $1 Coupon, $19.75. ($3 extra Denver and West.)

Write for "Conscious Rest"

A striking little booklet fully describing "Conscious Rest" and showing many pleasing Royal models. Book also brings name of your Royal dealer. It's free.

All Royals guaranteed. None genuine without the word Royal stamped on Push Button.

TWENTY-FOUR HOURS IN JUNE

(Continued from Page 17)

I was so excited when I saw my first palm! And here, when I got out my new frocks, that had come all the way from New York—some of them—I sang and laughed. And then—the lorgnette squad shot me dead! Oh, am I so—so homely or something?"

"I think you're one of the most—oh, I can't even say it—one of the bulliest—and oh, prettiest and all—girls I've ever seen. Maybe the other women are jealous. Probably the old society hexes tell their sons to steer clear of you; they want them to marry ugly girls with lots of money."

"No; they don't worry enough about me for that! But it's sweet and dear of you to pretend that's the way it is. And thank you for reassuring me that I'm not really covered with rattlesnakes." The daughter of the Wild West rose and made him an ante-bellum curtsy. As she settled down, with a fluff of lace, she sighed: "I don't suppose I ought to be quite so brazen and absolutely fish for compliments from a complete stranger; but I'm so glad to have somebody tell me I'm still an inoffensive little thing."

"Seems to me you aren't very complimentary to say I'm just a somebody. Like saying that I'm kind to my Aunt Alice, but dance like an ice wagon. Am I as bad as that?"

She laughed at him.

"Am I?"

"I think you're a terribly nice boy, with nice eyes and a nice slim waist and good shoulders, and jolly to talk to. Oh, I am brazen! That's what your polite Palm Beach has done to poor modest me!"

They both looked shy, stared at the sea, tried to keep their eyes apart, flushed a little, dug vigorously at the sand—then glanced at each other and laughed aloud, like boy and girl.

"Come help me finish my sand castle!" he cried. "That's a modest game, anyway!"

"'Deed I will! All my life, back where it's prairie gumbo and lakes, I've wanted to build a huge sand castle on the seabeach, and I tried it here; but—it wasn't much fun—making one all by my little self."

"Poor kiddy! Come on."

She came with a smile and a flare of skirts and twinkling slippers; and they forgot they were strangers. They were both at the age when one is fiercely militaristic, and they provided the castle with defense against cavalry, aëroplanes, submarines, poison gas, catapults, bowmen, and the elephants of Alexander the Great.

Bert had never seen such delicate texture of skin as was now agitating his heart when she bent above the sand walls with shining throat. But she was so voluble that he forgot to study her at all—forgot to wonder at her.

When they sat back and admired the edifice he marveled:

"Is this really the first time you've played on the seabeach?"

"Yes. I suppose you were brought here by your folks when you were, oh, just so little. That's the way it is with all these people, I guess. And poor me, here only a week! Maybe that's one reason why I'm such an outsider."

"Oh, no," he said in a blasé manner that would have caused the buyer at Grafenheimer Brothers' to observe "What's matter, Bert? Got the nosebleed?" He comforted her with "No; it's only comparatively recently that I've started coming to Palm Beach." He was recalling the description of Palm Beach he had been studying in the day coach a few hours before. "Have you seen the Jungle Trail or had twilight tea in the Coconut Grove?"

"No; mostly I've just sat round and comforted daddy. He's felt as much out of it here as I have. I started to go through the Jungle Trail in one of those cunning Afromobiles; but I was so lonely I made the darky turn right round and come back. And I never could get daddy to have tea in the Grove with me; he said that he was afraid one of the waiters would ask 'Who was your grandfather?' before he'd let us in. It must be lots of fun to know the place as you do. I suppose you belong to the Beach Club and everything."

"The Beach Club? Bradley's?"

"Yes!"—in the manner of a girl asking a Junior about his fraternity.

"Oh, well, it's a decent place," he stated, with a wave of his hand which dismissed to the caféteria class the exclusive spot that is supposed to have one of the best cuisines between Spuds and Cudjoe. "But the gardens, now! That's what you want to study. Finest in the country. Glad to take you round; and then we'll see about lunch. And—uh—your father, if he'd care to come. But —— I don't want to be a bold, bad New Yorker, but may I ask what your name is? Mine is Albert Michado."

Her incandescent face dimmed.

"I have a horrid name!" she complained. "My first name is after an old aunt, and my last name isn't a name at all; it's just a kind of something so they can send us butcher bills. And we aren't anybody, and you never heard of us; and, as daddy says, our family must have come over on the Mayflower steerage and been missed by the reporters. So, what is the use of knowing my silly name?"

"So I can write you—send you a post card from New York sometime."

"Oh, yes! With 'Having a nice trip. Wish you were here!' on it. . . . Don't you loath people who write that?"

"Yes; idiotic!" assented Bert, it being fully sixteen hours since he had written that message to some grouchy girl—Pribble or some such name.

Then the fairy girl waited for Bert to insist that she tell him her name; and he insisted, and she laughed; and he teased, and she said she was Mrs. Solomon K. Nasty, of the Cross-Bar Y Ranch, Idaho; and he was sure she was the wittiest and most amusing companion in the world; and told her so; and she blushed and said she was really Miss Napoleona Bonaparte; and he seized her hand and declared that he would not let it go till she told the truth; and she tried to get her hand back, but didn't try very hard; and they both blushed and laughed. And ——

"If you must know," she said, "my name is Ocea Boggs."

"Osha?"

"O-c-e-a. Isn't it silly! Aunt of mine."

"Ocea Boggs!" He started; he stared; his voice rose and grew nimble. "Boggs, did you say? Boggs? I say, where do you come from?"

"Davenport, Iowa."

"Say—gee-whiz! Say, tell me, who is your father? Bet I know—know about him!"

"You wouldn't have heard of him. He's just in business."

"What is his business? Tell me!"

"Oh, he just has a silly old factory—the Boggs Button Works. You wouldn't have heard of it, any more than the rest of these people here."

"Heard of it! Why, my dear, I know he's the biggest man in buttons—I mean I have some friends who are interested in dry goods, and they often speak of him."

She leaped up and started running; you know how a cat jumps when it comes on an unexpected frog—sideways in the air, with all four feet spread out at once. So she skipped; though with only two feet in the air at once. Bert gaped after her. She drilled through the lessening crowd. She stopped beside a gray-haired solid man in a gray, dull sack suit. She dragged him up, like a kitten dragging a mastiff. Bert heard her say in her light, eager voice:

"Daddy, come quick! Here's somebody that knows who we are!"

He heard the man rumble:

"But who the dickens are we, Bunny?"

Towing the large man, she came panting back; and Bert rose meekly to greet the Colossus of Buttons, the lodestar of the notions world, the idol of Mr. Albert Michado.

"My daughter tells me you have—uh—what is it, Bunny?" said the large man meekly.

"Pleasure meet you," said Bert with as much manner of grandeur as he could recover from the wreck. "Often heard friend of mine who's in dry goods speak of you—Sid Grafenheimer, of Grafenheimer Brothers."

"Oh, yes," said Mr. Boggs. "Think I've heard of him."

"Nice chap."

"Let's see; they're New York. You from there? Well, sir, you got a wonderful city there! But it's too much for me. Don't go there often. Well, I'm very pleased to meet you, Mr. ——"

"Michado."

"—— Michado. Glad you and Bunny find something to do. We're plain folks

WE are confining our entire production to a single eight-cylinder chassis.

We know it to be most remarkable of all the many Cole achievements.

It is the largest Eight built—but relatively the lightest.

Think for a minute what that means.

Here is a car that rides with the ease of a bird on the wing.

Its motor has the quick response, the noiseless action and the tremendous vitality possible only in an Eight.

Its body has the room and the luxurious comfort that size alone can give.

Yet the light weight of the Cole Eight safeguards your pocketbook. It gives you more miles per gallon of gas than most sixes—more than some fours.

In short, the Cole Eight couples the known advantages of size and power with those of lightness and economy.

No wonder the Cole Eight is a phenomenal success!

No wonder we are producing three times as many cars as we did at this time last year—and are building nothing but Cole Eights!

Our dealer in your town will gladly demonstrate any Cole Eight model.

BEAVER BOARD

FOR BEAVER WALLS & CEILINGS

Knotless, Crackless, Manufactured Lumber

Nature cannot produce real lumber so free from knots, cracks and blemishes as Beaver Board.

Here, if you please, is a manufactured lumber built up from the strong, clean fibres of the spruce tree into sturdy, rigid panels, ready without planing or dressing, for your wall or ceiling.

All the advantages of the clearest lumber stock, without its blemishes. And in widths which only the mammoth redwood of California could supply in natural lumber.

Is it any wonder that this vastly improved wall and ceiling material is rapidly supplanting lath, plaster or metal wherever particular people are building new rooms or remodeling old ones?

For the ceiling problem, Beaver Board is the one logical solution.

Send for booklet—"Beaver Board and Its Uses."

The Beaver Board Companies
100 Beaver Road Buffalo, N. Y.
Canada: 300 Wall St., Beaverdale, Ottawa.
England: 4 Southampton Row, London, W. C.
Australia: Builders' Exchange, Sydney, N. S. W.
United States Branches at Boston, New York, Baltimore, Cleveland, Detroit, Chicago, Minneapolis, Kansas City and San Francisco.

Manufacturers also of Beaver Blackboard and Beaverbilt Utilities.

BEAVER BOARD

You can't expect Beaver Board results unless this trade-mark is on the back of the board you buy.

(Concluded from Page 46)

from Ioway and kind of out of it here with you gay New Yorkers. Well—uh —— Found a fellow here from Seattle; been talking politics with him." And Mr. Boggs deprecatingly disposed of himself.

Ocea had sunk on the sand, cross-legged, and she seemed waiting for Bert to come back to her.

"You're not a 'plain folks'," he said. He wanted to add, "You're adorable"; but he compromised on "You're a peach!" And he made that sound like what he meant.

"No; I'm not. I'm a useless little hussy; but dad really is a peach. Mother died five years ago; and dad is terribly busy with his factory and trying to make his old processes safe for the workers. But he plays with me as much as he can. He pretended it didn't matter, and he said we were here just for the sunshine; but I know he was terribly hurt when I didn't meet people here or have a good time."

"Wonder if he liked me?"

"Uh-huh! He did."

"Oh, I bet he didn't! Bet he thought I was just a fresh kid."

"No; I could tell from the way he's been smiling from the first."

"How do you mean?"

"He's been watching us from over there ever since you first spoke to me, and he smiled and nodded to me."

Bert felt feeble at being under the observation of the genius, and Ocea was laughing at him.

"For once I have something on a New Yorker," she rejoiced. "Oh, you don't mind, do you?"

"No."

"I'm glad. It's been nice to play with you. And daddy likes it. Poor dad! I suppose he thought somebody like Freddy Witherbee would come right up and ask me to go riding. . . . Doesn't Freddy look like a muff, there?"

All his life Bert had heard of Mr. Frederick Schermerhorn Witherbee as opening balls at Newport and bottles at the Tennis and Racquet Club. He had seen pictures of Freddy in polo costume, motoring costume, and practically no costume at all at Mrs. Fipnogle's cubist ball. But Bert did not move in the same part of the younger set as Mr. Witherbee. His set was both younger and not quite so set, and better acquainted with beef stew than with terrapin. He had never chanced to see Freddy till now, when Ocea's finger indicated a young man engaged in looking vacuous—a task that was a mere bagatelle for the clever Freddy. . . . Yes; he had, too, seen him! Freddy was one of the two Johnnies who had sat near him on the porch and encouraged him to go and take Palm Beach away from them.

"Oh, yes; Old Freddy!" said Bert.

"Oh, do you know him?"

"Very slightly, indeed. Just see him about."

"I'm glad you don't. I've been watching him; and I much prefer Billy Yurka, that I used to play mibs with when I was little. Billy's mother is the best washerwoman in Davenport. But Freddy —— I should love to know how it talks. Is it human?"

"Oh, yes; Freddy isn't a bad sort. Just kind of dull."

"Do make him come and have a drink with us after the bathing time. That's what's made me most lonely of all—all the people so friendly and rosy and excited after bathing, having a snippet on the porch at the Breakers, and the music; and everyone talking and looking so jolly and foreign—like a boulevard. Could you get him to come?"

Her voice was almost down to a whisper and her eyes trusted him.

"Why, of course! Just a moment," he said boldly.

For those dear eyes of the fairy girl he would have tackled three Freddies and a Newport matron with protected daughters. He went and sat down beside Freddy. He yawned, and said in the most bored of voices:

"How-do, Witherbee?"

"How-dee-duh?" said Witherbee; but he didn't really seem to care how Bert did.

Like all well-informed New Yorkers who study the great problems of the day, Bert knew Freddy was a graduate of Yale, where he had made all his athletic records by taking female parts in college dramatics.

"Dropped into the Yale Club just before I came down," Bert drawled, "and chap there asked me to give you his regards and two dollars he owed you."

"Eh? Who was that?"

"Isn't it beastly? Can't remember. Rotten bore, isn't it? Do forget people so. But here's the two dollars." He peeled the money from his roll—his innocent bantam of a roll—and tossed it to Freddy, who took it questioningly. "I'll remember chap's name before I leave and tell you. Better pay now, anyway. Rotten have such a rotten memory—what?" Bert was giving an almost perspiratory imitation of all the English comedies there are. "Ever forget people like that, ol' man—even chaps from Yale? Dear classmates and that sort of rot?"

With some of that financial acumen he must secretly have had to have accumulated nineteen millions on his twenty-first birthday, Freddy put the two dollars away before he answered, almost civilly:

"Oh, yes; in fact, just for the moment I don't recall your name."

"Michado. Don't you remember? Track team? After your time, of course."

"Oh, yes; to be sure!"

"I say, Witherbee, I have a Western cousin of mine here—chap named Boggs; jolly old boy, billionaire; terribly pretty daughter—the girl by herself, over there on the right. If you're toddling up to the Breakers for a drink I wish you'd walk up with us. I don't want to lose you before I remember the name of the chap who paid me the two dollars to give you."

"Why—uh ——"

Freddy looked bewildered. "What the juice was all this about?" his massaged countenance said, so far as it could say anything except "To rent, totally unfurnished."

"Right-oh!" said Bert cheerily. He bellowed "Ocea! Come! We must be trotting up to the Breakers. Witherbee is going up for a drink with us. Come on, Mr. Boggs."

Ocea and her father obeyed; and a wonder as to how he had ever let himself in for accepting an invitation from a stranger spread itself over Freddy's face. When Ocea was introduced to him he became much more interested in her than he had been in that sterling Yale hero, Mr. Albert Michado.

It was not a long walk to the Breakers and Freddy did not escape. He joined them at a table, as though they really belonged. Bert's trouble was not in retaining the only genuine Freddy, but in being at his own party. Ocea seemed absorbed in Freddy; and Freddy, now that he had been canonically introduced to this fair outsider by his old college chum, was willing to smile and haw at her.

"I'm an awful little barbarian!" she was saying. "I've never seen any polo. Won't you tell me how you defeated the California team last year?"

Now Freddy hadn't defeated any California team last year. Freddy hadn't defeated any team any year. Freddy couldn't have defeated a team of pea weevils at croquet. But he was a sub-substitute on a Newport polo team, and he gave an account of the game as played by the Safety First method. Bert discovered that Freddy wasn't a fool when talking to women. When talking to men—especially strange men—Freddy had the vocabulary of a Lithuanian cook and the originality of a compromise presidential platform. But Freddy was used to girls and he had no shyness about looking into their eyes as though he were demanding how far he could go.

He asked Ocea how she liked Florida; he asked her how she liked his "silly, rotten" new ring; he coaxed her and teased her, and apparently he made her oblivious of her forlorn little playmate, Mr. Bert Michado.

In the presence of dear old Freddy Mr. Boggs had nothing to say to Bert except that it was a fine day—really a mighty fine day; and Bert was left to talk to his glass of lemonade, to which he confided that he hated Ocea, desired to scrag Mr. Freddy Witherbee, and, as for Mr. Boggs, he would be dog-goned if he would work for the Boggs Button Works—not if he were offered the New York agency, with Mr. Vibels as office boy and Miss Pribble as window washer!

Between quivers of jealousy he was the victim of financial anxieties. With much care he slipped the bill for their round from under a plate and peeped at it. Freddy had desired a sandwich with his drink, and Bert hadn't desired one but had haughtily taken one; and the bill was two dollars. Plus the two dollars he had given Freddy, that made four. And he wanted to take the Boggses to lunch. Probably eight dollars more. He could pawn his watch in Jacksonville. Though he smiled fashionably, the jolly old Yale athlete could not keep from muttering over and over "Let's see now; two and two and eight—no darn it, prob'ly nine, with tip ——"

But he kept his eyes on Ocea while he had the chance. It began to appear to him that she was not entirely captivated by Freddy. She nodded and blushed at him, but her lively lips seemed to be quivering; and once, when Freddy was slightly boastful about his motor run from Jacksonville to Palm Beach, Bert thought he felt her toe softly kicking him.

He took heart. He devoted himself to getting rid of the Gilded Youth with as much earnestness as he had recently shown in capturing him. He looked at his watch, turned it different ways, and studied the second hand. Freddy seemed to have very little interest in Bert's opinion of the time.

"Now, now!" he was waggishly saying to Ocea.

Bert acted like a great executive. He rose.

"Well"—curtly—"time to get ready for lunch, children. C'm on!"

Freddy seemed bewildered. Sudden changes of base were hard on his brain. Bert pictured him tagging along. He chirped:

"Glad to have seen you, Witherbee. Still can't remember chap's name that paid me the two dollars. See you again."

Freddy nodded, teetered at Ocea and wabbled away. Bert captured Ocea and firmly led her off. Her father followed.

"You're at the Poinciana, I believe?" said Bert formally.

"Why are you so stern about it? We're at the Poinciana; but that isn't naughty, is it?"

"No; but —— I'm glad you liked Mr. Witherbee so much."

Bert spoke with an air of settled martyrdom—like an old, well-trained martyr who has been burned, imprisoned and bitten by ants constantly for years and years.

"Why, you pathetic baby—didn't you understand my kicking you under the table? I'm disappointed in you! Can't you see it will be dreadfully exciting, when I get back home and there's a picture of Freddy in Fashion, to show it to the girls and tell them I met him here? But, like him? Why, I think he's a silly ——"

"Do you like me better?"

"You are nothing but a vain child."

"Do you?"

Just then Mr. Boggs caught up with them and absorbed them in his heavy personality; but she smiled at Bert, and he was content.

"Don't suppose you could take lunch with us, Mr. Michado?" begged Mr. Boggs.

"Why—uh—I hadn't made any plans."

"Then, come—come on, lad! Bunny and I pull out for home to-morrow and we want to have a good time the last day."

▼

"SORRY I can't take you to lunch at this Beach Club, but I don't belong," said Mr. Boggs apologetically; "and I guess we'll have to make out with the regular hotel lunch."

"Oh, it's perfectly all right, and not a bad dining room," Bert graciously acceded, glancing over the Gargantuan hall and dropping a condescending look on the menu. . . . He had got over the danger of having Mr. Boggs ask him whether he was registered at the Poinciana and his meal already paid for, by casually stating that he was in Palm Beach only for the day. And he had had time to realize that he was incredibly lunching with the boss of Mr. Everett Vibels, who was the boss of Miss Pribble, who had been too superior even to want to be the boss of Bert Michado. He was fascinated. He wanted to talk buttons, despite his pose of being an idle dog, with inherited wealth. He achieved:

"Oh, I say, I seem to remember that I met your New York representative—a Mr. Wibles or Gibles, or something."

"Oh! Everett Vibels. How'd you happen to meet him?"

"Dropped in there one time with Grafenheimer. Nice chap."

"Yes. Course I've got to admit Evy Vibels will never set the world afire; but he's a good lad."

Bert nodded with aged understanding.

"What business you in, Mr. Michado?" shot out Mr. Boggs. "I suppose, like the rest of you young New Yorkers here, you take it easy."

Bert had a desire to dodge the question. He had so recently been advanced to the position of Heir that he had not as yet learned all the details of his own biography. He said desperately:

"Well, I'm beginning to take an interest in Sid Grafenheimer's place. Believe in chap working ——"

"That isn't so very different from my own line. Buttons. You ought to get out of a congested hole like New York and come out to Ioway and learn the business. But I don't suppose ——"

"Wouldn't mind it a bit!" exclaimed Bert, and waited, trembling; but Mr. Boggs changed the subject.

"Bunny says this most highly respectable sack coat of mine isn't the proper caper for a place like this, and I must say I like you young chaps in flannels. Must I be obedient to my daughter and wear giddy things too?"

Between them—while Bert's chances of the future managership of the Boggs Button Works went glimmering—Ocea and he gave the great man instruction as to what he ought to wear and eat, and think about tennis and dancing and the habitual use of the ukulele. And the Titan almost promised them to take dancing lessons.

Before lunch ended Bert said: "If your father wants to smoke a cigar after lunch, why don't you and I take a spin through the Jungle Trail in a double wheel chair? Let's forget our other duties. Don't believe in cutting a party short when it's going well."

"Let's!" she said.

VI

JUNE'S enchantment of soft light and blossoming green and fluttering wings, of soaring skies and time stopped in its course, while Bert rode by the side of the fairy child. They talked great poetry, though it was couched in "No," and shy "Yes," and whispered "Isn't it corking?" For once he was not playing games.

They dismissed the wheel chair in the Trail; they walked through its wilderness and back to Lake Worth. They sat between huge palmettos and looked over amethyst waters. Twilight was coming and there was a strain between them. They had shared so many confidences—as many as strangers could. He was in a panic. Time had begun to move again—and so rapidly! In no time now he would have to take a train back to winter.

"We might go and have tea in the Grove?" he said desperately.

"Ye-es."

"And then pretty soon I must be rambling North; evening train."

"I'm sorry you're going. I'm—oh, I am sorry we can't play together to-morrow."

"I don't know whether I'll ever see you again. I never did know a girl like you; you're like a silver thread ——"

"But you must know hundreds of girls much nicer than I am, lots of nice little silver threads, in New York and Newport, and all."

"I never saw Newport in my life!"

"But ——"

"Honey, honey, honey, I can't leave you lying to you. I'm not rich. I'm not a swell. I'm a New Yorker, all right; but I'm just a bum little nineteen-dollar-a-week clerk. I haven't any social position and I don't know Sid Grafenheimer—I work for him; and that's just the opposite of knowing him. I never saw Palm Beach before yesterday ——"

"Jiminy, I'm glad!" she cried. "Then you will come out to Davenport and take a job with the factory, and you and I will play every Sunday!"

"Your father would never give me a job."

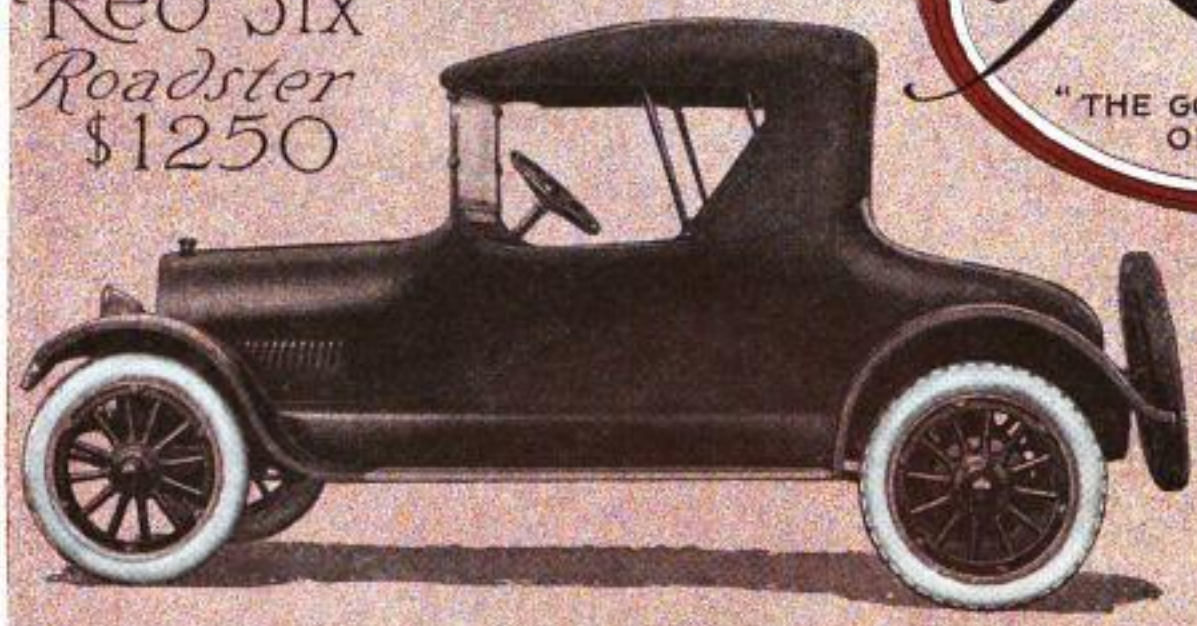
"You dear old silly—remember daddy spoke to me after lunch? He told me to get you to come out and learn the business. I've been getting up courage all afternoon to ask you. He is looking for someone like you, with New York training, like Evy Vibels; and not so hoity-toity as Evy, but jolly and up-an'-coming."

"Gee-whiz! I've always wanted a job with the Boggs Works."

"Then why didn't you come and ask?"

"Is that the stunt? Honey! Listen! Sometime there will be something else I'll dare to want."

"Then you come and ask!" she whispered. And, jumping up, she went skipping off with him, exclaiming: "Come! Daddy knew you weren't really rich, because you kept looking into your cigarette box, and then not taking a cigarette after all. We aren't so much slower than you New Yorkers."



"Gee!" said Bert.

REFINED AND IMPROVED in many important details, making for betterment in performance and in riding qualities, but essentially the same in design. For We Reo Folk saw to it that this Six was fundamentally right before we let the first one leave the factory.

SINCE THEN WE HAVE incorporated such changes as we thought would enhance the pleasure of riding in this car—longer wheel base: improved spring suspension: improved carburetor: silent spiral bevel driving gears, and other features formerly found only in Sixes of the highest price.

IF YOU WERE TO ASK US how good this new Reo Six is, we'd say, "as good as Reo the Fifth, 'The Incomparable Four'"—and this is a full size, seven-passenger Six, built for the man who wants the utmost of luxury at the intrinsic worth of the same.

BODY DESIGN IS NEW—in keeping with the progress of the art, the vogue and the preference of buyers.

THIS CONCESSION we always make to the buyer—a body made to his taste and in the latest style.

IN THE CHASSIS we give him that which we know he ought to have—if our long experience and engineering ability is worth anything.

IN EXTERNAL DETAILS it is your ideal of a luxurious equipage—in mechanical principles and construction it is our idea of what constitutes a good automobile.

REO 3-UNIT SYSTEM makes what we believe to be "the Most Accessible Automobile in the world"—hence the low upkeep cost of Reo Sixes.

"50 PER CENT OVERSIZE" in all vital parts—such as bearings, shafts, frame, gears, wheels, wiring, radiator, etc.—makes this Reo Six perhaps 1000 pounds heavier than some of other similar "rated" power and passenger capacity.

THAT IS THE BEST GUARANTEE of the quality that is in this Reo Six. For we do not skimp on either the size of parts nor quality of material to meet a price competition.

ORDERS FOR THIS NEW REO SIX must be in your Reo dealer's hands well in advance of the time you desire delivery.

DEMAND IS TREMENDOUS and will increase immeasurably as the big Spring demand opens up and as owners begin to extol the superiorities of this big, beautiful, New Reo Six. For surely at $1250 this is "The Gold Standard of Values" in Sixes.

OUTWITTING THE WOLF

By Enos A. Mills

ONE day in Western Wyoming an elk was killed by hunters. It was left lying on the ground all night. Its only protection was a handkerchief tied to one of the horns. Tracks in the snow showed that wolves were about and that they had circled the carcass, but without going close enough to touch it.

In another instance I knew of, a deer was left out all night in the wolf country.

"How did you protect it?" someone asked the hunter.

"By simply rubbing my hands over it," he answered.

A mature wolf will not eat or touch anything that has human scent upon it, or that carries the scent of iron or steel, which he evidently associates with the deadly scent of man.

A cowboy shot his injured pony and left it lying on the plains. The pony was shod. Wolves did not touch the carcass. On another occasion and in the same locality a pony was killed by lightning. It was not shod and carried no human scent. Upon this pony the wolves were feasting within a few hours.

The wolf in his struggles with man has become an extremely cautious animal. He is hunted and pursued with deadly ingenuity and persistence. Guns, traps, poison and dogs are used for his destruction. There is no quarter for him—always a price on his head; and the sum is large. Survivors must be exceptionally wide-awake and wary. The numbers that still survive show that this exacting price of existence has been met. They have not been beaten. Altogether, the wolves now alive probably are much more destructive than their ancestors were, and far more capable of saving themselves from extermination by man.

Much of the time wolves hunt in coöperating packs. They run an animal down by following it in relays; sometimes one or more wolves lie in wait at a point of vantage while others drive or force the victim into the ambush. On an island in Alaska a number of wolves in relays chased a deer and at last drove it into the sea. Near the point where it leaped into the water a swimming wolf was in waiting.

Three wolves chased a young antelope through my mountain camp. Though they nearly ran over me, I doubt that either the antelope or the wolves saw me. On they went across the plateau. I hoped that the antelope might escape; but just before he reached the top of a ridge I saw a wolf peering over. The antelope and the wolves disappeared on the other side, where I suppose the drifting clouds and steadfast pines again witnessed a common tragedy of the wild.

On another occasion I saw three wolves drive a deer from a cañon and so direct its course that it emerged where the way was covered with a deep snowdrift. As the deer floundered through the soft snow it was pounced upon by a fourth wolf, which was lying in wait at this point.

Killers of Cattle

Wolves prey extensively on cattle and sheep; and to a less extent on horses, pigs and chickens. Many stockmen think that a single pair of wolves may damage cattle herds to the value of a thousand dollars a year. A single wolf has been charged with killing eighty head of cattle in a year, or even ten head of stock in a month. Occasionally a pair of wolves may kill a number of animals in a day. In Texas the red wolf feeds on cattle, colts, sheep and goats—the gray mostly on cattle; while the black shows a fondness for pork of a better grade than razorback.

Wolves occasionally capture the young, the stupid and the injured among deer, sheep, elk and moose; but the percentage of big-game loss from wolf depredations probably is not heavy. These wolf-chased animals have developed a wariness and endurance that usually enable them, except perhaps during heavy snows, to triumph over this enemy.

Economically the food habits of wolves are not entirely bad. In many localities they prey freely upon those ever-damaging pests—mice, rats, rabbits and prairie dogs. They are also scavengers.

The vast herds of buffaloes used to be constantly followed by countless packs of wolves. At that time the gray wolf was commonly known as the buffalo wolf, and he is still often spoken of by that name. The stronger buffaloes usually defended endangered ones from the wolves, which were watchful to pounce upon any stray, weak or injured animal.

Well-authenticated accounts tell us that often a number of buffaloes would convoy a calf or a wounded buffalo to a place of safety. What a strange thing it must have been, out on the plains, to see a pack of wolves, fierce and fiendish, endeavoring to break through the buffalo line of defense that surrounded a retreating calf! Except while migrating, buffalo bulls appeared to have the habit of standing guard over a sick or injured buffalo until the weak one got well or died.

The cattle-raising country has a wolf population. Formerly wolves followed the buffalo herds in their long drifts and migrations up and down the plains. They now follow the cattle herds in the West; they winter with the cattle in the lowlands, and in the summer accompany the "beef on hoof" up into the high ranges among the peaks.

Clever Teamwork

When they come upon a herd of cattle they isolate one; then one or more wolves systematically attack the head while another or others attack behind. Their powerful jaws snap quickly and cut or crush deeply. They endeavor to hamstring the victim.

On one occasion, in Southern Colorado, I saw a herd of cattle standing in a circle with their heads outward. A number of wolves were attacking them. By leaping unitedly—first at one, then at another—they finally frightened one victim out of the circle of safety. He was at once driven away from the herd, and in a short time the wolves had disabled his hind legs and pulled him down.

On another occasion, in North Park, Colorado, I saw two wolves pull down three two-year-olds in a short time. I watched them through a field glass. One wolf attacked in front while the other kept leaping and snapping at the flanks and legs until the animal fell. These three animals were killed in less than half an hour. As they were not eaten, the killing was apparently for the amusement of the wolves.

In wolf-infested cattle territory it is common for one or more cows to guard the calves while the other cows go to water. At a ranch where I made my headquarters for a few days, the plan was being tried of equipping every thoroughbred calf with a bell. This practice proved only temporarily effective in keeping wolves away.

The wolf has extraordinary endurance, great strength, senses amazingly developed, and exceptionally powerful jaws. He is a good swimmer. I have seen wolves swimming vigorously in rivers, wide lakes and among breakers. They appear to be equally at home in the mountains, in the forest, in thickets or on the prairie. They probably live from eight to fifteen years.

The coyote, or prairie wolf, is a distinct species, much smaller and with more fox traits than his big brother, the gray wolf.

The average weight of a mature gray wolf is close to one hundred pounds. In exceptional cases they have been known to weigh one hundred and fifty pounds. They are, therefore, about twice the weight of the coyote, or prairie wolf, and considerably larger and heavier than the average collie. For the most part those near the Arctic regions are larger than those in the southern United States.

Seen in profile at a distance, the back line is comparatively straight. The ears rise just a trifle above this line; in front of the hips the back sags a trifle; while the tail is extended almost straight, with the point held slightly above the level of the back. With the coyote the ears are more prominent, the back more swayed; and the tail droops at a very sharp angle, with the point turned a little upward.

The howl of the wolf is deep, while that of the coyote is shrill and high-pitched. It appears that wolves have a language and a system of signaling. These consist of howls, snarls and barks of varying length, with varying spaces or accents. Wolves prowl and howl mostly at night; but it is not uncommon for them to hunt or to wander in the daytime.

The gray wolf is known, also, as the timber wolf. He may be gray, grayish yellow or grayish black, occasionally reddish; and now and then he verges on cream color. The color varies greatly, even among the members of a single and perhaps related pack.

Formerly the gray wolf was distributed practically over all North America. Though classified into various subspecies, it really was the same wolf in Florida and Alaska, in Labrador and Arizona. In different localities he varied in size, color and minor characteristics; he necessarily adapted himself to the food supply of his locality and followed the necessary means of getting his food. But everywhere he was really the same gray wolf.

The present wolf population of the United States is not numerous; but it is active, aggressive and destructive. The animal probably has been exterminated in most of the Eastern States and in California. The coyote probably is economically more beneficial to man than the gray wolf, and does less damage to man's cattle.

In common with most animals, wolves live on a fixed or home range. They spend their life in one locality. This has a diameter of fifteen or twenty miles. To a certain extent its area and form are dependent on the food supply and the topography. One wolf that I knew of had a home range that measured forty by ten miles.

Much of the time wolves run in pairs; and, from both my own observation and that of others, I believe they commonly mate for life. Their home is a den. This most frequently is upon a southern slope. It may be of their own digging or a badger or a prairie-dog hole which the wolves have enlarged; or it may be a natural cave. In the woods it may be in a huge hollow tree. Almost invariably single pairs have a den to themselves. I have heard of a few instances where two litters of wolf puppies were found in the same den; but probably the second litter, in an emergency, had been moved into the den for safety.

Painted Wolf Pets

Among Indians wolf pets are common. At an Alaskan Indian encampment I was once greeted by a number of romping Indian children who had several black-faced wolf puppies with faces painted vermilion and yellow.

The puppies are born early in March. The number varies from six to twelve. For the first few weeks they are almost black, especially about the head. For a period after the young cease nursing, the mother stays with them much of the time, while the father hunts and brings food to the entrance of the den or into it. At the age of a year the young wolf is still puppylike, and apparently he does not reach maturity until more than two years of age.

Young wolves are sometimes seized by eagles or foxes; and all wolves are subject to attacks from parasites and disease.

The wolf is closely related to the dog family; in fact, a Husky, or Eskimo dog, is a domesticated wolf. The track of a wolf is almost identical with that of a dog.

Old storybooks are full of tales of wolf ferocity. Wolves pursued the lone horseman, or even attacked the occupants of a sleigh. A fiddler returning at night was forced to take refuge on top of a deserted building or in a treetop; or a mail carrier narrowly escaped with his life after losing his sack. All too frequently we still hear stories of wolves attacking a solitary traveler; but careful investigation of these stories shows them to be sheer fabrications.

Wolves within the bounds of the United States are not ferocious; they do not attack human beings. That they were once ferocious is probable; but years ago they learned the folly of exposing themselves to human beings.

Notwithstanding all this, the wolf is not a coward. He is brave enough when anything is to be gained by being brave. The spectacular, reckless grand-stand bravery that is pretty certain to be accompanied by death does not appeal to the wolf. Instances are on record, however, where numbers of wolves have risked their lives in order to save or to try to save a wounded companion, either from men or from animals.

A man captured and brought home a number of wolf puppies and placed them in a box inside a high picket fence. He thought the mother might come to their rescue and prepared to entrap her. He took off a picket of the fence, and placed steel traps inside and outside the fence and in the gap. On the first night the mother did bravely come to the rescue; but she avoided all dangers and carried off her puppies.

In Montana I once saw a pair of wolves attack a broncho. The horse, which was exceptionally keen-witted and agile, fought the wolves off successfully for several minutes, and finally smashed a hind leg of one with a kick. He then became aggressive and endeavored to stamp the injured wolf to death. Under the brave protection of the other wolf, which fiercely fought the enemy, the disabled one tried to escape; but the horse landed a kick on this fighter, crippled it, and finally killed both.

Quick to Learn

The new environment of wolf life that accompanied the approach of man demanded a change of habit. Many things that wolves had always done—which had been good enough for their ancestors—must be done no more; things that never had been done must be done at once. It was the old, inexorable law—the survival of the fittest; the passing of those which could not change and cope with newly imposed conditions.

Anyone who has had experience with wolves is pretty certain to conclude that they are intelligent—that they reason. A trapper who thinks that a wolf is guided by instinct, who fails to realize lupine vigilance, and forgets that wolves are always learning—ever adapting themselves to changing environment—will be laughed at by a multiplying wolf population.

With astounding quickness the new dangers man introduced into the wolf world were comprehended and avoided. In the decade following 1885 wolves appear to have gained knowledge of human ways more rapidly than man developed in his knowledge of wolf ways. This rapid mental development on their part cannot be called instinct. Plainly it was a case of intelligence and the wisdom of experience. Surviving wolves have simply learned absolutely to avoid those insidious means of death that high bounties have led man to invent for their extermination.

Apparently, too, old wolves promptly educate their children; so that the youngsters avoid these new complex dangers. Whether this education is consciously given on the part of the old wolves matters not. The fact that wolves multiplied in the midst of the concerted and relentless war waged against them by man indicates that the youngsters learned how to take care of themselves from the experience and not from the instincts of their parents. The safety-first slogan in the wolf world appears to be: "Avoid being seen by a man; and never, never touch anything that carries the scent of man or that of iron or steel."

A generation or two ago a wolf took no pains to keep out of sight; now he uses his wits to avoid being seen. Then it was easy to trap him; now he has become exceedingly difficult to trap. Long-range rifles, poison and steel traps brought about these changes. It was about 1880 when wolves began to develop this cunning for self-preservation. Heavy bounties brought numerous trappers and hunters into the wolf domain; but such was their development that, despite this incessant warring, for fifteen years the wolves actually multiplied.

In the cattle country you will find the wolfer—a picturesque character engaged in

What the Guarantee Promises —These Tires Deliver

If we call the definite mileage guarantee by its real name, what do we have? Nothing more than tire insurance.

You, the tire-buyer, pay for that insurance—just as you pay for any other item in the tire-maker's overhead.

Its cost, as are other overhead costs, is absorbed in the price of the tire you buy.

And in all such tires marketed, overhead fights with quality for place.

Goodyear Cord Tires carry no definite mileage guarantee. *They are independent of any charge whatsoever that does not confer a material benefit upon the tire itself.*

Their capacity for prolonged and economical service is insured by what their maker puts into them, not by what he says about them.

Their broad utility is guaranteed by perfect materials perfectly put together.

And their quality is real and actual—unimpaired by fictitious costs of any sort.

At the last, it must be recognized that the miles a tire delivers, spring directly from the structure and substance that resist the punishment of the road—and not from any written estimate of the virtues such elements may possess.

And it must be admitted, also, that there is small consolation for the man stranded on a lonely road, in the thought of an adjustment counter twenty miles away.

For the guarantee never will be penned that can be fitted to a rim, and ridden upon.

And that, it seems to us, is the final answer in this guarantee matter: not what can be looked for on paper, but what can be looked for underwheel.

To this end, we have built Goodyear Cord Tires in the strictest spirit of the practical—built them not on a chance of what they might perform, but straightway to a service they are sure to perform.

We have stripped the process of their making of every quality-sapping cost.

By perfected organization, by efficient manufacture, by universal distribution and the absence of expensive insurance schemes, we have discounted overhead to the last possible penny.

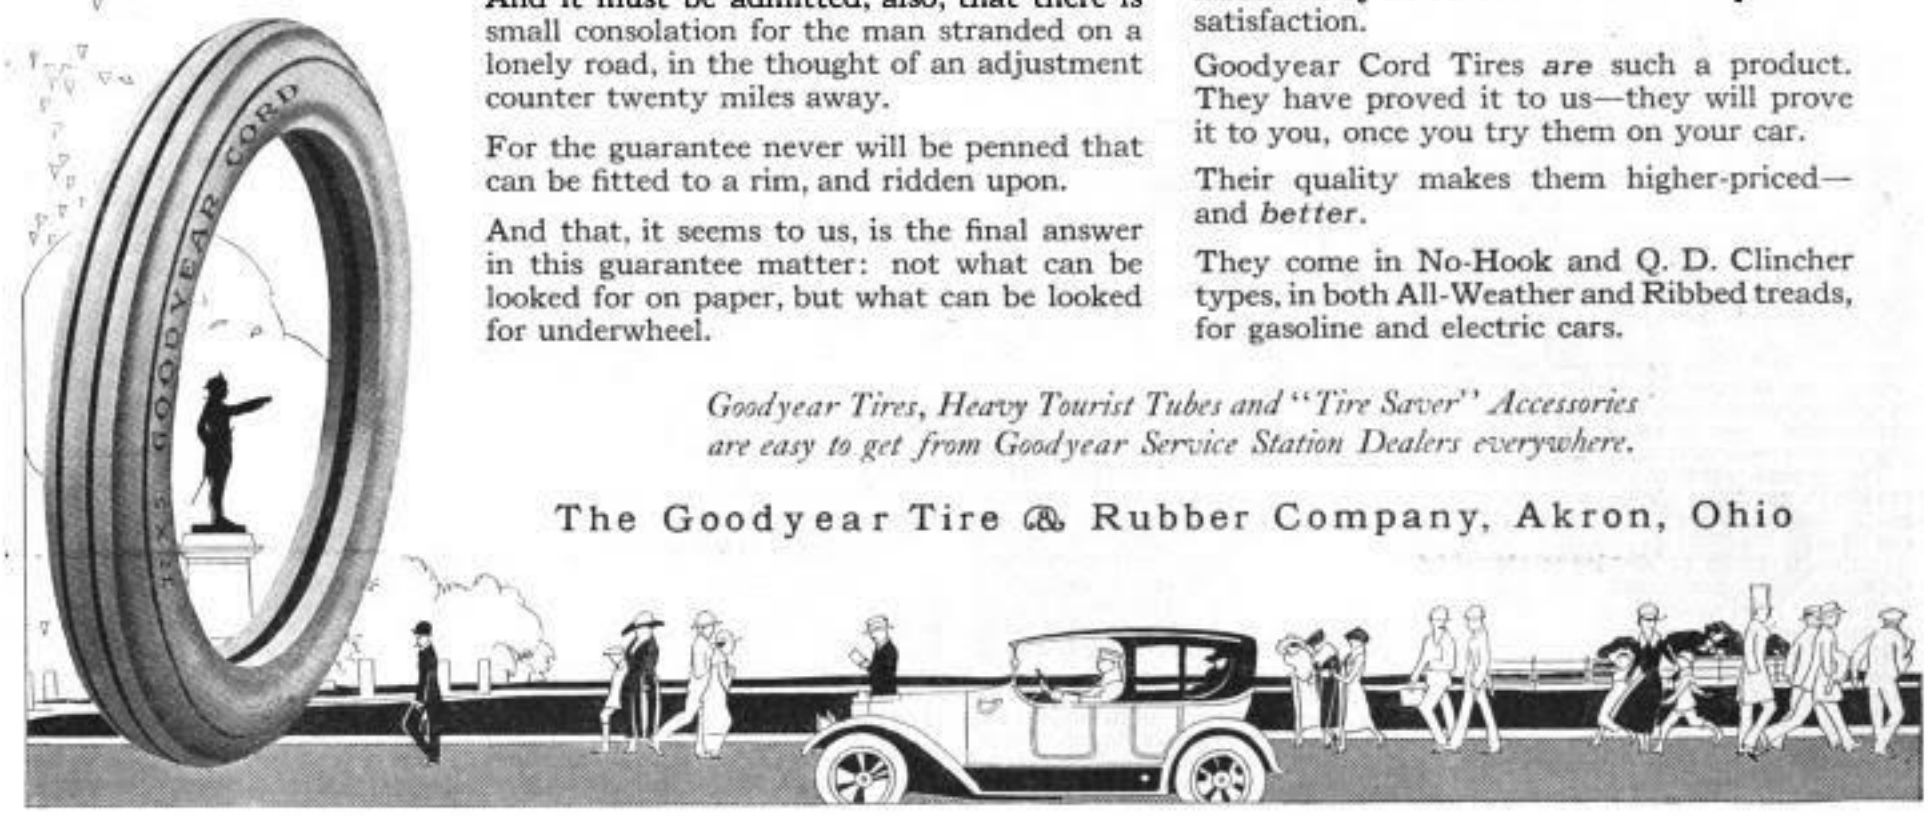
And every dollar you pay down for a Goodyear Cord Tire buys the good that is in the tire—nothing else.

Beyond dispute, the best fire insurance is a fireproof building. By the same token, the best tire insurance is a flawproof tire.

Goodyear Cord Tires command this enviable designation. And their greater comfort, their lasting strength, their surer security, their uniform quality and downright *goodness*, constitute the best insurance of exceptional service we are able to contrive.

Particularly, when supported by the Goodyear policy that you—the tire-buyer—*must* be satisfied.

It requires a notable product to justify a confidence so profound that its guarantee is measured by no other limits than the patron's satisfaction.



Goodyear Cord Tires *are* such a product. They have proved it to us—they will prove it to you, once you try them on your car.

Their quality makes them higher-priced—and *better*.

They come in No-Hook and Q. D. Clincher types, in both All-Weather and Ribbed treads, for gasoline and electric cars.

Goodyear Tires, Heavy Tourist Tubes and "Tire Saver" Accessories are easy to get from Goodyear Service Station Dealers everywhere.

(Concluded from Page 53)

the peculiar occupation of trying to exterminate wolves. His equipment consists of a rifle, traps and poison. A few wolfers follow their occupation the year round. Many of them are free trappers—some of them old-timers who have seen better trapping days. Many of them enjoy good earnings, chiefly from the bounties paid for wolves, a smaller income being from the sale of the wolfskins.

In some instances a wolfer is employed by a cattlemen's association; in others by a big cattle company. In some cases the free trappers receive board and lodging at a cattle ranch—usually so long as they care to trap in the same vicinity. Often two of these wolfers go together. They have a spring wagon, a tent, a team, a saddle horse and the necessary trapping munitions. They begin operations by going over the territory and placing their traps, sometimes employing as many as three hundred. Often it takes two or three days to make the rounds of all these traps.

When a wolfer meets another wolfer, or when he is discussing business with stockmen and others who are interested, his talk is likely to run to "Three Toes," a wolf that killed so many cattle on the S. S. Bar Ranch; or to "Old Two Toes," which John Jones succeeded in trapping. He is eager to hear how Smith trapped the last wolf. Just as the prospector has faith that he will find the mythical lost mine, many wolfers firmly believe that they will yet compound a scent which will please the nostrils of the most wary wolf and lure him to his doom.

The hunter and the trapper keep bringing forward new and skillful ways of poisoning and trapping wolves. But getting a wolf becomes increasingly difficult. The majority of wolves now trapped are the young or the stupid ones. Many trappers use traps by the gross. These are set in clusters in selected places—in narrow trails, round carcasses, and in the approaches to stream crossings. The traps are concealed; placed in water; they are deodorized, hidden, and false-scented with offal. Whole batteries are placed before or round a stake the top of which is highly scented with something alluring to wolf nostrils.

One day I watched a trapper spend several hours in placing more than a hundred traps round the carcass of a cow. He avoided touching the carcass. This concealed trap arrangement was as complicated as a barbed-wire entanglement. At one place he set the traps three abreast and five deep. On another probable line of approach he set ten traps, singly, but on a zigzag line. Two fallen logs made a V-shaped chute, which ended close to the carcass. In the narrow end of this chute another cluster of traps was set. Thus the carcass was completely surrounded by numerous concealed traps. It seemed impossible for any animal to walk to the carcass without thrusting a foot into one of the steel jaws of this network of concealed traps. Yet a wolf got through that night and feasted on the carcass!

Clever ways have been devised to keep human scent off the poisoned meat. Poison is inserted into pieces of meat without touching them with the hand. Then these choice dainties are taken on horseback in a rawhide bucket and scattered with wooden pincers, the dispenser wearing rubber gloves. Yet most wolves will starve before touching these morsels, evidently scenting the poison!

Forced by poison and traps to avoid most dead stuff that man has touched, the wolf is compelled to do more killing. Then, too, his special development and increased experience, together with his exceptional equipment and opportunity, afford him a living and leave him spare energy and time; so for the fun of it he kills and kills, like a game-hog.

A tenderfoot arrived at a Wyoming ranch where I was staying. He proposed to go wolf hunting, and expressed a hope of being able to make a living by pursuing wolves. He was most heartily laughed at by the cowboys and the old-timers. He finally set off alone to kill a wolf. Wolves were all about the country. He had never seen one, but he had read of their habits. Patiently he searched until he found an entrance to a wolf den. Hiding in a favorable position, he lay in wait. The second day, as the pair emerged for food, he shot both. In less than a month this tenderfoot had found eight wolf dens within a small district. These dens were not known to the three cattlemen and the rancher who lived in that district. But this happened several years ago.

Until recently it was a rare thing to find a cattleman, a rancher, or even a hunter or a trapper, who appeared thoroughly acquainted with the habits of wolves. It was also a rare exception to find one of these men who had searched carefully for a wolf den, or who had actually hunted wolves in a systematic and painstaking manner.

Fencing with woven wire has been recommended by the Biological Survey. In many localities this appears to be practicable. It has been tried with success not only in this country but also against wild animals in Australia, New Zealand and Africa.

There has been a lack of conservation in many campaigns against wolves. Organized hunts, the employment of unskilled wolfers and the payment of bounties have generally been poor investments; and they have not exterminated wolves. Wyoming at one time had a county bounty, a state bounty and a stockman's bounty, averaging in the aggregate from fifteen to fifty dollars. In special cases as much as a thousand dollars has been offered for the pelt of a single destructive wolf. Yet in these times of high bounties wolves actually multiplied. A prominent stockman recently said:

"From now on there will be intensive cattle raising. This includes intensive wolfing—that is, we shall fight wolves with brains."

Even the most conservative figures of the total annual wolf damage to stock and ranch interests in the West go up into millions of dollars. The amount annually lost and the money annually spent in trying to destroy wolves, together with the vast payments in bounties, aggregate an enormous sum. If an equal amount was spent on fences the results would appear to be far more helpful and of more permanent benefit to the stock interests, and perhaps would hasten the destruction of the wolves.

Then, too, stock raising is beginning to be carried on in a more intensive manner. Smaller and more privately owned ranges everywhere, better grades of stock and more care of the grass—all these would help solve the damaging wolf problem by attracting more serious and intelligent attention to it.

To eradicate wolves, then, it appears necessary to understand their life habits and to use vigilance in discovering wolf dens. Vernon Bailey, of the Biological Survey, who probably has studied wolves longer and more carefully than almost any other man, emphasizes the importance of searching for dens. He says:

"A steep south slope is usually selected for the den, preferably a barren bad-land slope, but sometimes merely the wall of a rocky cañon or a sagebrush hillside, broken by ledges or strewn with large bowlders—locations that afford good sentry posts from which the old males can watch for the approach of enemies.

"Knowing the kind of country the wolves breed in, it is only necessary to ride over it until wolf tracks are found. Good tracking snow often lies on the ground in Wyoming, Montana and the Dakotas during the early part of the time when the young are in the dens, and this makes it particularly easy to find them; but even where there is no snow it is entirely practicable to locate them by riding along the crests of the ridges and across good wolf country.

"Except for the tracks of an occasional pack of bachelor wolves which wander through the country in the breeding season, it is safe to assume that every track either goes to or comes from a den. When a track is found the direction of the den can often be told by the lay of the land and the time when it was made. Since the wolves hunt mainly at night, to find the den a track made in the evening should be followed backward, and one made in the morning, forward. As the tracks approach the den they often gather into well-worn trails or runways, which become so conspicuous near the den that no mistake can be made as to its location."

As has been shown by a tenderfoot, by Vernon Bailey, of the Biological Survey, and by others, the way to exterminate wolves is to search out their dens. The finding of the den usually insures the capture of the pups and often of the entire family. As the old ones are much abroad in the month of March, searching for food for their young, the discovery of the den may often be made at that time; for the ground is then likely to be covered with snow, marked with telltale tracks made by the wolves in leaving and returning to their homes.

The latest and best word concerning wolves in the cow world is that a number of cattlemen, ranchers and the boys of settlers are carefully combing the territory near home for the lair of the wolf.

THE CONTROL OF FOOD SUPPLIES IN BLOCKADED GERMANY

(Continued from Page 8)

are determined by the products of their soil—the Italian cooks with olive oil, the German with lard. The adult clings to that upon which the tastes of childhood have been formed. The arts of the cuisine enter with cultivated classes, quite as indispensably as the nature of the ingredients; and service is as important as preparation.

Now these external standards of our diets have an influence upon the utilization of our foods. Foods that provoke distaste do not receive the same treatment by the digestive apparatus that will be accorded foods to which the individual is accustomed. There are, of course, wide variations in these reactions. But foods that must be eaten without appetite and enjoyment do not provoke the same response upon the part of the digestive apparatus which is accorded to foods that are relished.

The average person can force himself to eat almost anything; hunger drives one to eat the most revolting food. But the nervous system that has to tolerate such a situation is likely to develop abnormal reactions, and nutritional disturbances may arise. The nutrition of prisoners of war must be considered from this point of view; the prisoner of war must eat what the country of the captor offers him, no matter how repugnant to his tastes.

These external factors of a diet become problems when a nation has to undergo a generalized rationing. Under blockade, the people of Germany have to do without certain things to which they had become accustomed. In order to be fair to all, the attempt had to be made to give each German the same amount of the same food. Under the regulations they were all to have the same diet; and to this they object, as a natural reaction of their tastes. The fixed ration and the paucity of fats necessitated the cooking of foods in a manner that was repellent to many. A nation under blockade must abandon, in part, the external relations of a diet.

German agriculture has labored under many difficulties. The soil of Germany is of inferior grade, considered as a whole. Prussia, which contains nearly sixty-five per cent of the area of the empire and possesses about two-thirds of the arable land, has relatively little of really first-grade soil, and nearly one-half of the acres are of distinctly low grade. Large areas of Bavaria, Baden and Würtemberg are mountainous. Much of the soil of Northern Germany is sandy.

The climate of Germany is of indifferent quality, agriculturally speaking. Extremes in precipitation are common, both drought and excessive rainfall being of frequent occurrence. The seasons of 1911 and 1914 presented crop failures. In the summer of 1915 there was drought during critical months; during the summer of 1916 there was excessive rainfall. The temperature inclines to be subnormal; the summers of 1915 and 1916 were unusually cool, and the maturation of crops was placed in jeopardy thereby. The soil requires heavy fertilization and demands intensive cultivation, entailing much labor. Rotation of crops in some sections is made unusually difficult by the chemical composition or physical properties of the soils.

As a whole, the soil of Germany is distinctly inferior to that of the British Isles and markedly inferior to that of France. Nevertheless, agriculture is eminently successful in Germany. This has been due to the fact that the cultivation of the soil has been made the subject of intensive scientific study; farming has been made a veritable chemical industry.

The area of Germany is about 133,580,000 acres. Of this about 82,275,000 acres are under cultivation, using the term in the broad sense. The variations in acreage for the different crops has been slight during the past five years. Notable is the high percentage of grains and carbohydrate crops—sugar beet and potato—sixty-two per cent; and the small acreage under grasses—thirty per cent. In England and Wales two-thirds of the land is devoted to grasses and one-third to crops; in Germany one-third is devoted to grasses and two-thirds to crops.

German agriculture has displayed a progressively increasing efficiency during the past forty years. In the thirty years before 1913 the average yield of wheat rose from 19 to 32, barley from 23 to 36, oats from 25 to 44 bushels to the acre, while the yield of potatoes rose from 3.5 to 5.5 tons to the acre. When the cultivation of the sugar beet was first undertaken between eight and ten tons of beets were required to yield a ton of crude sugar; now less than six tons of beets yield a ton of crude sugar. Seventy-five persons are now fed with the produce of each hundred acres of cultivated land in Germany. This very excellent result has been due largely to artificial fertilization and scientific rotation of crops.

Four fertilizers are required in agriculture—nitrogen, phosphorus, potassium, and the organic substances that are called humus. The last is supplied by natural manures and turned-in cover crops. Under nitrogen are included nitrate and ammonia. In peacetime Germany applied to her soils large amounts of sodium nitrate and the saltpeter of Chile. In the years just previous to the war Germany imported some 750,000 metric tons of Chile saltpeter, of which about 500,000 tons were applied to the soil.

In addition to this, ammonium sulphate, to the extent of 94,000 tons—in terms of nitrogen—was applied to the soil, this being equal to about 650,000 tons of saltpeter, the ammonia having been derived from coke ovens. In addition to these, small amounts of calcium cyanamide were also used. This is very intensive artificial fertilization. Phosphorus, in a state of basic slag, Germany possesses in her iron industries, though obtained in part from imported ores. The amount of basic slag used in 1913 was in excess of 1,900,000 tons. Superphosphates were also imported, largely for use as fertilizer, from the United States, Algiers, Tunis and the South Seas, about eight hundred thousand tons having been used in agriculture in 1913.

Germany possesses potash deposits of almost unlimited extent, the world's largest source of this chemical. Under these circumstances potassium compounds have been lavishly used as a fertilizer. Though it is recognized that nitrogen is, on the whole, the most important of the fertilizers, free use of potassium compounds and phosphate with the nitrogen results in the largest yields; and for certain crops—sugar beet—potassium compounds are of particular importance. The average use of these chemicals on the soil in Germany in the years just preceding the war was stated in Germany to have been, in metric tons for each hundred acres: of nitrogen—as nitrogen—0.20; phosphorus—as superphosphate, thirty per cent soluble—3.65; and potassium—as potassium oxide—0.46; in all about six million tons.

The amount of natural manure available for use depends upon the number of domesticated animals and upon the extent to which concentrated fodder is used in their diet. It is probable that natural fertilizer is not more used to-day in Germany than thirty years ago. The marked increase in yield of crops, of the grains especially, is due to three factors: Use of artificial fertilizers; selection of seed and of strains; and improved cultivation.

Probably half the gain has been due to the intensive fertilization; in recent seasons the use of artificial fertilizer has yielded additions to the harvest of grain that may be estimated at from five to eight bushels an acre, or from three million to six million tons a year, of a total of from twenty-five million to twenty-seven million

Notable Maxwell Records

IN APRIL, 1916, some interesting economy tests were conducted on the Brooklands track, London, Eng. Several makes of cars were used in testing out a new fuel mixture. Of all the cars entered, a stock Maxwell Touring Car made the most notable record, delivering a mileage of 33.6 on a gallon of the fuel. This performance was witnessed by a representative of "Autocar," the most conservative motor car journal of England, and he wrote as follows:

"In this article we are concerned primarily with the action of the new fuel, but we feel it only fair to give a word of praise to the behaviour of the Maxwell, which, brand new as it was, ran exceedingly well throughout the tests, and showed altogether remarkable acceleration and hill-climbing ability."

IN April, 1916, an economy test was made around Table Mountain, South Africa, which contains two fairly steep grades, and a stock Maxwell Touring Car made 31.3 miles on seven-eighths of a gallon of petrol.

IN August, 1916, tests for the economy of Maxwell Cars were made by Prof. David L. Gallup, professor of gas engineering of Worcester Polytechnic Institute, at the Narragansett Park Speedway, Providence, R. I. The following results were obtained and announced by him.

Speed (Miles per Hour)	Economy (Miles per Gal.)
10	33.7
15	32.7
20	31.2
25	28.8
30	26.1
35	23.0

MAXWELL MOTOR CARS

are designed and constructed primarily for service under the average and usual conditions. They were never intended for stunts, racing speeds or any other extraordinary purposes.

It has simply been our aim to build a light, economical, durable car and to build it exceedingly well.

It is interesting to note, therefore, certain instances which prove that Maxwell Cars are not only performing their specific function—but that they possess, in reserve, a surplus merit which enables them to achieve marked distinction in events *out* of their field and class.

The facts and figures here presented throw some light on why the Maxwell is generally recognized as *The World's Greatest Motor Car Value.*

ENCLOSED CARS

Town Car $915 *Cabriolet $865*

Sedan $985

All prices f. o. b. Detroit

AT the Virginia State Fair, held in Richmond early in October, 1916, a Maxwell stock touring car won a big economy run in competition with practically all the four-cylinder cars sold in that city. The contestants were started with one-half gallon of gasoline in a special tank provided by the fair authorities. The Maxwell distanced all competitors by a wide margin, covering 13.3 miles on the half-gallon.

IN February, 1916, Ray F. McNamara drove a Maxwell Roadster from Philadelphia to Pittsburgh, 293 miles, in 8 hours and 19 minutes, averaging about 36 miles an hour. The run was made over snow-packed roads and part of the trip was through a heavy snow storm. The run was checked at both ends by newspaper men. The record still stands.

IN July, 1915, McNamara drove a stock touring car from Detroit to Indianapolis and return, 620 miles, in 20 hours.

McNAMARA also established a record for the drive from Portland to Spokane. The distance is 458 miles and the elapsed time was 15 hours, 31 minutes. The best previous time was 20 hours, 30 minutes.

LATE in November, 1916, a stock Maxwell Touring Car was driven out of Chicago and reached LaCrosse, Wis., a distance of 300 miles, in fourteen hours. High speed over icy roads cut into the tires and there were four blowouts. Despite deep snow and terrible roads, the car had no mechanical difficulty.

AJAX TIRES

GUARANTEED IN WRITING 5000 MILES

ARE REGISTERED TIRES

AJAX Tires come of fighting stock. They were the first *independent* tires. Twelve years ago, they entered, single-handed, a monopoly-ridden industry—and won. They won the only way they *could* win in the teeth of violent opposition—on *quality*.

Quality was their armament and intrenchment—and their quality-challenge was the *first* tire guarantee.

The Ajax service-pledge in writing—5000 miles—is held inviolate today as then. Ajax inaugurated a straight-away policy of cards-on-the-table dealing with the tire owner. It met immediate and lasting response.

There is no longer a tire monopoly, but the Ajax initiative—the Ajax fight to maintain always-higher inbuilt quality—goes on and on.

In every industry there is a product that lifts itself, by sheer merit, by an actual service-showing above the rest—a product that achieves separate and supreme distinction. In tires, we honestly believe this master-product to be Ajax.

And when you consider the enormous yearly sales of Ajax Tires—the tremendous growth of the business—and remember that Ajax Tires are not regular equipment of the cars they are largely bought for, but the *individual choice* of thinking motorists to replace *other tires*—you have indisputable proof of leadership.

Ajax Tires are still of "fighting stock"—built for conquest in gruelling road test. They have stamina, spring and vitality—rugged resistance. Made of the cream of rubbers and quality fabrics, by the pick of tire-makers to one standard—the highest.

And note that now—in line with the Ajax policy of initiative always—Ajax Tires are *registered* at the home office in the individual tire owner's name as further insurance and protection of the Ajax Guarantee in Writing 5000 Miles minimum service. Consider that this means, based on the implied service of other standard makes, 43% more tire miles, a saving of $3 to $15 per tire according to wheel size.

Ajax Registered Tires prove Ajax determination to serve to the uttermost mile.

Ask your Ajax dealer for a copy of "The Story of Ajax Tires" by Horace De Lisser, Chairman of the Board, Ajax Rubber Co., Inc. It tells an unusual business story of romantic interest and solid fact.

While others are claiming Quality, we are guaranteeing it

(Continued from Page 56)

tons. Artificial fertilizers have alone made it possible to raise the huge crops of potatoes and sugar beets annually produced in Germany. The potatoes yielded pork, and the sugar beets made her an important factor in the sugar market of the world.

Germany possessed large herds of domesticated animals—of horses some 4,500,000; of cattle, from 20,000,000 to 22,000,000; of sheep and goats, 9,000,000; and of swine, from 21,000,000 to 33,000,000—depending upon the time of the year. Since Germany had only one-third of her agricultural land in grasses and two-thirds under cultivation for crops, it is clear that this livestock must have been nourished to a large extent upon concentrated feeds. Germany did not produce enough such fodder to feed her stock; she imported each year from one-fourth to one-third of the requirements of her livestock. This situation was, from the military point of view, the weakest spot in German agriculture. Germany was much more dependent, directly and indirectly, upon imports for her meats and dairy supplies than for her grains.

The economic situation in German agriculture has been one of exceptional strength. About ninety per cent of German agriculturists own the land they till; and, of the total land under cultivation, about eighty-five per cent is in the hands of the denominated ninety per cent of farmers. There are nearly four million holdings under five acres, some ten millions under fifteen acres; and half of the acreage is in holdings of less than fifty acres. Intensive cultivation demands abundance of labor, especially of female labor. Not only do all crops require careful cultivation in Germany, but the sugar beet in particular makes most exacting demands upon hand labor.

Just prior to the war about twenty laborers were engaged on each hundred acres of cultivated land, which, as previously stated, sustained about seventy-five persons. Of these laborers, one-third were not permanently engaged in farm labor, but migrated from place to place and from task to task. Not less than a million Russians were wont to migrate into Germany to work upon the farms during the summer. A large fraction of the native transient farm labor was engaged during the winter in forestry and in factory work connected with agriculture, as in sugar refineries, potato dryers and distilleries. Of the workers permanently employed in farm labor about half were women; of the transient workers in the fields two-thirds were women.

The progress of German agriculture has been greatly aided by the paternal attitude of the government. In every possible way—in schools, scientific experimentation, price control of supplies, financial aid and a protective tariff—the government has promoted the development and intensification of agriculture. This has been done, in part, for economic reasons; in part, however, it was done in order to make Germany self-sustaining in foodstuffs—in short, as a military measure.

The Lack of Fatty Foods

Excellent as German agriculture is, a critical survey indicates that there were several points of weakness in the system. The first was the extreme dependence upon hand labor, the relative and absolute scarcity of machinery for the most efficient handling of the crops. Farming by hand labor cannot respond to suddenly increased demands.

The predominance of female labor was another weakness. Though it was true that women were free of military claims and thus secured as farm laborers, had they not been already engaged in farm work their entrance upon such work in a time of emergency would have meant a positive increment in labor forces. Furthermore, the work of women cannot be speeded up as in the case of men. In a word nearly the total working power of the agricultural population was, in time of peace, already engaged in cultivation of the soil; when the men were withdrawn there were few within that class who could be called into activity, and a tremendous impost of extra work was placed upon the remaining workers, largely women.

Finally, a very grave defect was the lack of fat-bearing crops. This was not a lack imposed upon German agriculture by latitude, longitude or climate. For forty years specialists had been urging the necessity of the cultivation of fat-bearing crops and the pressing need of selection of the most advantageous varieties, several of which had been experimentally shown to be adapted to conditions of soil and climate in that country. But it was so much easier to raise potatoes and turn their starch into lard that German agriculturists neglected this development of their resources.

The agriculture of Austria-Hungary was primitive in comparison with that of Germany. The ratio of arable land to population is much higher in Austria-Hungary than in Germany. Hungary in particular is an agricultural state pure and simple; and Austria cannot be termed an industrial state. The total food production of the dual empire before the war was largely in excess of its own consumption and much foodstuff was exported. But the efficiency of agriculture was low; scarcely more than half a crop of any kind was gathered in Austria-Hungary as compared with Germany. The methods of cultivation were primitive and superficial, and the yields represented largely the natural excellence of the soil. Little use was made of artificial fertilizers and crop rotation was not systematically carried out.

When war broke out it was naturally supposed that the excess foodstuffs of Austria-Hungary would be made available to Germany. But, with the withdrawal of the men from the land to enter the army, the production fell to such an extent that the dual empire no longer produced more than its own requirements, and the world was offered the anomalous spectacle of Austria-Hungary prohibiting by edict the exportation of foodstuffs to Germany.

There has been little improvement for Germany in this state of affairs with the continuance of the war; neglect of production and of distribution have gone hand in hand; and, without any effective control of consumption, Austria has been hard set-to with her own problem of food supply. It is characteristic of the German propensity for efficiency that during the summer of 1916 organizations were established in Austria-Hungary for the purpose of educating the people there in the methods of modern agriculture.

Imported Foods

The diet of the German people was a composite of food produced within their borders and imported from the outside world. Importation of food was both direct and indirect. Germany imported meat directly; she also imported feeding stuffs, from which meat was produced. In earlier times the diet of a people was the direct expression of the production of the land. The development of transportation and the diversification of trade have each decade altered more and more the diet of civilized peoples, so that to-day the differences in national diets are much less pronounced than was the case two or three decades ago. This internationalization of the diet has progressed to a greater extent in Germany than in the other Continental countries.

Bread was the staple article in the German diet, particularly in the southern portions of Germany, as it still is in the French diet. In Prussia, where the potato yields very heavily, the use of the potato was much higher than in South Germany. Sea fish was used to a large extent by the Prussians and in the western sections adjacent to the North Sea. Thirty years ago mutton was used to a large extent in Germany. Year by year this has diminished and the use of pork has assumed greater proportions; the use of beef was limited largely to the well-to-do classes in the cities. Everywhere dairy products comprised a large fraction of the intake, but particularly in South Germany. The use of sugar in Germany was limited until the development of the sugar-beet industry, since which time it has greatly increased, though never to the extent practiced in America.

Up to two decades ago the peasants of Germany consumed in large part their dairy products, and little else than butter and cheese was sent from the farm; the butter consumption for each individual was low. With the advent of the modern centrifuge the German peasant was able, in connection with the excellent transportation facilities that had been developed by the German railroads, to sell his cream to the cities or to dairies operating for the urban trade. The result was a lessened consumption of dairy products on the farm, a larger shipment of dairy products to the cities, and the importation of other food to the farm. The business was profitable, since the inhabitants of the German cities, as everywhere in the world, increase yearly their consumption of dairy products.

Since the amount of cream the peasant could sell was limited only by the amount he could produce, the number of cows was yearly increased; and, to feed these added cows, concentrated feeding stuffs were imported in yearly increasing amounts. In the years just before the war many landholders of Germany conducted extensive dairies operated largely on imported feeding stuffs. The development of pasture land had not kept pace with the increase in livestock; during the past twenty years only a small fraction of an acre had been added in pasture lands to correspond to each additional milch cow, whereby the dependence on imported feeding stuffs had become yearly more pronounced.

The diet of the people in the cities, as everywhere in the civilized world, has developed in the direction of the standards of the hotel cuisine. By this is meant the greater use of meat and dairy products, and the preparation of these according to the standards of the hotel service, rather than in accordance with the native tastes of the people.

The per-capita meat consumption of the Germans has doubled within the last three decades, and this increase has taken place largely within the cities. The peasant of Germany in 1914 consumed little more meat than previously. In order to supply the demands of the cities for meat—largely pork—the stockraisers of Germany followed the example of the dairymen: they increased the number of animals and imported the feeding stuffs required. It must not be inferred that the production of native feeding stuffs had lagged in Germany; on the contrary, the cultivation of grain has been very successful, and in yields to the acre the German farm ranks with the best. But the increase in livestock devoted to dairy products and to meat production was so disproportionate to the increase in grain production as still to leave the meat industry dependent upon importation.

So far as dairy products were concerned, Germany made no attempt to meet the demands of the dairymen for concentrated feeding stuffs. Fat is the ingredient most desired in forced feeding of dairy cattle; and concentrates rich in fat had never been developed in Germany, but were imported, largely from the United States, in the form of oil meal, oil cake, peanut meal, and so on.

Though transportation has tended to erase the distinctions in the diets of different classes and sections, aided always by the instinctive attempts of the poor to emulate the diet of the rich, nevertheless, three class diets were distinguishable in Germany—that of the agricultural population; of the industrial population; and of the well-to-do in the cities.

The peasants of Germany lived largely on the vegetal products of the soil, supplemented by dairy products and a moderate amount of pork and veal, plus cheese in the south and fish in the north. The bread ration was highest in the south; the potato and fat intake largest in the north. Meat was consumed largely during the winter; in summer the diet was almost vegetarian.

Normal German Diet

The diet of the industrial classes—and by this term is meant the workers in the mining and manufacturing sections of Germany—did not present the seasonal variations noted in the agricultural sections; the staples were rye bread, potatoes and pork; butter, milk and cheese were consumed in but limited amounts, and the total intake of the industrial workers was always lower than with the agricultural population. The diet of the well-to-do classes in the cities was the diet of the markets, following the seasonal appearance of domestic and foreign products of the soil, in accordance with price and supply. Large classes of the poor of the cities were annually unable to meet the exigencies of the market, and for several months during each winter every large German city supplied thousands of poor citizens with food.

German agriculture had for forty years enjoyed the benefits of protection by high tariff, aided by other regulations designed to encourage the production and discourage the importation of food. At every session of the Reichstag, conflicts developed between the Social Democrats and the Agrarians; the former desiring easier import of foodstuffs, in order that the cost of living might be reduced; the latter striving ever to maintain their monopoly of foodstuffs. The Agrarians always won out in these contests, aided by the influence of the military authorities, who preached the importance of such development of German agriculture as to make Germany independent of foreign foodstuffs in the event of war.

Shortly after war was declared the German Government called together a commission of scientists, to which was intrusted the preparation of a report upon which the defensive food measures of the empire should be based. This commission, commonly called the Eltzbacher Commission, devoted several months to the study of the production, distribution and consumption of food in Germany.

All considerations of the food supply of a people relate to production, distribution and consumption; but the statistical data available are fragmentary to a surprising extent. The data of production are largely the data of the expert, the assessor and the market, leaving the direct consumption by the agricultural classes, and by the small towns locally supplied, more or less out of the calculations. The figures of consumption are drawn from the data of flour mills, slaughterhouses, customs-house reports and trade journals, leaving large gaps that are filled by only crude estimates.

The Eltzbacher Inventory

There is nowhere any adequate checking up of waste; there is nowhere any clear separation of the proportions of produce that go to the maintenance of domesticated animals and of human beings. Nevertheless, the Eltzbacher Commission proceeded to make an inventory of the food consumption, food production and food needs of Germany in accordance with correct scientific procedure; though it is evident from reading the report that they were not always able to see the forest for the trees. Classified on the basis of derivation, the peacetime food supplies of Germany were naturally arranged as follows:

1. Plant food grown from German fertilizer.
2. Plant food grown from imported fertilizer.
3. Animal food produced from vegetation not fit for human consumption.
4. Animal food produced from nutrients fit for human consumption.
5. Animal food produced from imported feeding stuffs.
6. Animal food derived from inclosed and adjacent fresh and salt waters.
7. Plant food grown in surrounding neutral countries from native fertilizer.
8. Plant food grown in surrounding neutral countries from imported fertilizer.
9. Animal food produced in surrounding neutral countries from fodder native and not fit for human consumption.
10. Animal food produced in surrounding neutral countries from domestic nutrients fit for human consumption.
11. Animal food produced in surrounding neutral countries from imported feeding stuffs.
12. Animal food from fresh and salt waters of surrounding neutral countries.
13. Plant food from overseas direct.
14. Plant food from overseas via neutral surrounding countries.
15. Animal food from overseas direct.
16. Animal food from overseas via surrounding neutral countries.
17. Colonial wares from overseas direct.
18. Colonial wares from overseas via surrounding neutral countries.

A complete blockade would obviously exclude all food under Numbers 2, 5, 7, 8, 9, 11, 12, 13, 14, 15, 16, 17 and 18; but the financial interest of the citizens of the surrounding neutral countries does not coincide with the purpose of the blockade, which cannot be made complete under Numbers 7, 8, 9, 10 and 12. It was the purpose of the blockade to place every contiguous neutral country in an inclosed situation, exportation to Germany being made indirectly impossible.

It was clear to the Eltzbacher Commission at the outset that the direct results of the food blockade must result largely from the abolition of importation of fertilizers, feeding stuffs, meats and fats. An attempt was made to evaluate the foodstuffs produced in surrounding neutral countries independently of their own importations, but the results were very evasive. As a matter of fact, it has been the results of the application of the blockade that taught both the Germans and the Allies the exact

This is the Motorweave Man—a national figure—$6.75. Wherever you see him you will find genuine Motorweave

The Motorweave Man is At Your Service

HERE is a man it will pay you to know—the Motorweave Man.

About a year ago he saw an opportunity. He did a big thing. Now he has a nation of friends.

The Motorweave Man first thought of standardizing a quality automobile robe to sell nationally at a popular price —$6.75—guaranteed.

He made it durable, double-woven of fine reinforced woolen fabric with a warm, soft nap. He did not forget appearance. He used pleasing colors and modern patterns.

Motorweave received a truly remarkable sales ovation the moment it was placed in the national market. A tremendous demand came quickly—and everywhere! And the first season's success was built on only *one* design in only *five* colors.

* * *

The Motorweave Man hurried back to the factory for more. He got them to supply Motorweave in an immense line of assorted colors and patterns. He brought out a 1917 stock, more complete and comprehensive than any other robe manufacturer ever offered before.

And, note *this*—with prices increasing in every line of production and woolen material prices going steadily higher, he secured the factory's promise to hold Motorweave during 1917 at the *same standard price*—$6.75. At the same time, 1917 Motorweave will remain the same generous size, 60 x 80 inches, giving plenty of comfortable "tuck-in," even with three in a seat.

So, here he is today at your service.

Motorweave Robes Are Mill-Washed and Shrunk

Thousands of dollars' worth of new and modern machinery are employed in the mill-washing and mill-shrinking of Motorweave. Every atom of surface oil is removed by these latest processes. You may wash Motorweave yourself without danger of your robe shrinking. Simple instructions accompany every robe. Following these directions secures the user maximum satisfaction and long life for every robe!

In size, weight and texture it is ideal for motorists because it is made especially for motorists—the only robe so designed.

But that is not all. You will find Motorweave ideal also for lounging, camping and all outdoor purposes.

Demand to see the label and the guarantee. If your dealer does not stock Motorweave, send us your name and we will send you a handsome catalogue of the big 1917 line and will also see that you are supplied.

The Wallace & Smith Company, La Porte, Indiana

A Word to Dealers

THE Motorweave Man is fast establishing Motorweave Headquarters among dealers throughout the United States. His salesmen are now covering territory.

All dealers who stock Motorweave at this time will receive preferred attention on re-orders throughout the year *at the present standard price.*

Buy *now* and be sure of your year's supply!

Write us at once so that our salesman may call on you.

A Postal Will Do—

(Continued from Page 59)

extent to which the surrounding countries were able to contribute foodstuffs to Germany.

The Eltzbacher Commission devoted particular attention to Germany's own production of feeding stuffs. The following data had to be determined:

1. How many domestic animals were produced yearly?
2. How many domestic animals were imported and exported yearly?
3. For the animals produced yearly, whence came the feed?
4. How much roughage and green feed were produced yearly?
5. How much pasture had Germany for the different classes of livestock?
6. How much concentrated feeding stuffs were produced each year?
7. How much concentrated feeding stuffs were imported and exported each year?
8. How much concentrate was produced in the surrounding neutral countries?

As a result of their deliberations the Eltzbacher Commission prepared an elaborate report. In this report were tabulated:

(*a*) The amounts of foodstuffs consumed by Germany in a year.

(*b*) The proportions that were produced in Germany.

(*c*) The proportions of the foodstuffs that were produced in Germany from imported fertilizers and feeding stuffs.

The commission enunciated a standard for the food needs of the people of the empire, and the differences between the figures for *need* and the figures for *consumption* were portrayed as *waste*, which it was the imperative duty of the Germans to avoid in wartime. Recommendations for increased production were also formulated, whereby the restriction due to the blockade could be partly obviated.

Consumption and Production

A survey of the relations of consumption and production of concentrates and fodders made it clear that it would not be possible for Germany to maintain, under blockade, the normal number of domesticated animals. In order to reduce the number of animals to the plane of available feeding stuffs the commission recommended, after weighing the relative values of dairy products and pork on the basis of cost of production and availability in consumption, the slaughter of one-third of the swine and ten per cent of the milch cows, the numbers to be held to that level.

In addition to the work of this commission, independent scientists published the results of original investigations, confirming, in the main, the findings of the commission, though differing in essential features. Investigations were also carried out for the purpose of determining the total feed supply of the empire, in order that the subsistence of all domesticated animals might be planned out on a ration basis.

The writer has made an independent calculation of the food consumption of Germany based on official data for the years 1912 and 1913. The following table contains the estimates of four different calculations as stated for protein, fat, carbohydrate and calories per head per day:

CONSUMPTION OF FOOD UNITS IN GERMANY
1912-1913

	TOTAL				IMPORTED				DOMESTIC			
	PROTEIN Gr.	FAT Gr.	CARBOHYDRATE Gr.	CALORIES	PROTEIN Gr.	FAT Gr.	CARBOHYDRATE Gr.	CALORIES	PROTEIN Gr.	FAT Gr.	CARBOHYDRATE Gr.	CALORIES
Ballod	3.10	2.15	14.5	2708*	0.85	0.88	0.8	450*	2.25	1.30	13.5	2480*
Eltzbacher	3.30	3.75	18.7	3642	0.90	1.60	1.5	715	2.40	2.10	17.2	2927
Kuczynski and Zuntz	3.70	3.11	20.1	3550	1.13†	1.06†	1.4†	473†	2.57	2.05	18.7	3077
Author	3.25	2.33	16.0	2790	0.90	1.06	1.4	550	2.35	1.27	14.6	2240

*Lack of agreement due to fact that Ballod estimated exported sugar as a domestic food.
†Direct plus indirect imports calculated by writer.

The food needs of a people cannot be judged by the total food consumption, since this is much too high, including all loss and waste. The per capita consumption is directly misleading, because to divide the figure for total consumption by the number of individuals would mean that the suckling and dotard receive the same ration as the workingman. Scientists allow for the individual variations in what is known as the man ration. The food-need of the adult male is set at 100, the food-need of the adult female is set at from 80 to 90, and the food-needs of the different years from infancy on according to determined standards.

In the Eltzbacher report the German population was taken as 68,000,000. The number of children of each year and the number of adult males and females were known. The figure for the number of children of each year of age was multiplied by the figure for the food-need of that year. The number of adult females and the number of adult males were multiplied respectively by 85 and 100. The final figure for the needed food units—a compromise between several standards—was 51,822,908.

Close Figuring

This figure means that the population of 68,000,000 would be nourished if it received the ration of 51,822,908 adults. Three thousand calories was the figure set for the adult need—100. The caloric needs of the German people were, therefore, determined by the simple multiplication: $3000 \times 365 \times 51{,}822{,}908 = 56{,}750{,}000{,}000{,}000$ calories. When this figure for total calories, determined on the basis of man ration, is divided by the figure for the population, the result is 2280 calories a day; in other words, the per capita ration corresponded to seventy-six per cent of the man ration.

The protein needs of the people were also calculated. Children under six years of age were allotted 1.4 ounces a day; from six to twelve, about 1.75; from twelve to eighteen, about 2.3. The adult men were allotted 2.9 ounces; the adult women were vouchsafed 2.4. The total daily protein needs for the population were, therefore, set at 1,605,000 metric tons a year.

Hindsight has made it certain that the figure set for caloric needs a day—3000—was too low. It was, of course, realized that the workingman would need much more; but this, it was felt, would be balanced by the large number of women, who would need less. But in a great war most women are laborers, not nurses, as the preparedness-for-women movement in this country seems to assume. The units allotted the growing child from twelve to eighteen were too low. A boy of this age has a heat production one-fourth larger than an adult; in fact, an active growing boy consumes as much food as a hard-working man. More important than this, the extra work that must be done in a state at war was disregarded. Practically ten million men have been withdrawn from their occupations. The work done by these men may be fairly stated to have necessitated a thousand calories intake each a day. If the work these men used to do was to be done by the remaining civilians, these must be given a proportional increase in diet. That the work has been done by the extra exertions of the civilians is the testimony of all who have been in Germany during the war. In other words, the fifty-eight million civilians must be allowed ten billion extra calories. As the extra work is done by civilians from twelve years of age, these denominated calories must be divided between some thirty-nine million, or about two hundred and fifty calories a day above the needs of the peace diet. With these considerations in mind, the writer has calculated the protein and caloric needs of the German people in wartime, and reached these figures: protein, 1,524,000 tons; calories, 63,000,000,000,000.

The figures for peacetime requirements in protein and calories adopted by the German commission are higher than competent investigators in different parts of the world regard as necessary. In particular, what might be termed the American school, led by Chittenden, regards as adequate very much lower intakes of foodstuffs; and these figures are based upon extensive tests with healthy men over long periods of time.

Before the war, Chittenden used to be called an *Anticivicus Fanatiker;* and in the German discussions of diet during the first year of the war this attitude was still apparent. Later results, however, have converted the Germans to Chittenden's ideas. One German humorously observed to the writer: "The Chittenden standard of eating had been almost as valuable as the Hindenburg standard of fighting." It will make the matter clearer to set these figures in a table:

PROTEIN NEEDS

	PER CAPITA	MAN RATION
Eltzbacher	2.30	2.83
Author	2.15—wartime	2.5
Chittenden	1.5	1.8

CALORIC NEEDS

	PER CAPITA	MAN RATION
Eltzbacher	2380—peacetime	3000
Author	2510—wartime	3300
Chittenden	2030	2600

From the data collected by the Eltzbacher Commission it was clear that the peacetime consumption in calories was from one-third to one-half in excess of physiological requirements, and that the calories of domestic production in peacetime were sufficient to cover the needs. The peacetime consumption of protein was fifty per cent in excess of the figure accepted for need; and the domestic production of protein was just large enough to cover the need. It was also apparent from the data that the fat consumption of peacetime was so large as to deserve the term luxurious, and the fat of domestic origin was enough to cover the normal requirements.

On paper, therefore, it seemed clear to the German scientists that if the German people would reduce their consumption to the plane of physiological needs, and maintain the domestic production on the peacetime basis, they would be able to sustain a food blockade without injury. It will be of interest to tabulate the recommendations of this commission, not only because they make the whole question clearer, but because they illustrate the systematic scientific consideration given to the questions.

Food Recommendations

The difference between need and use, the waste of one-third to one-half in protein, fat and carbohydrate, *must* be obliterated, since, if this waste continues under domestic production, want would be inevitable.

All luxurious living to be controlled—especially in public eating places.

The plane of peacetime production must be at least maintained. Necessary to this end is adequate labor on the land, sufficient use of fertilizer, proper rotation of crops, careful garnering and proper storage.

Production to be increased by cultivation of vacant land.

The cultivation of vegetables to be encouraged and the public exhorted to eat more vegetables and cereals and less of animal products.

The use of rye bread to be encouraged; that of wheat reduced.

The raising of hares, goats and sheep to be encouraged.

Exportation of foodstuffs to be prohibited and the importation of foodstuffs from neighboring states to be encouraged.

The use of grain for the manufacture of starch and alcoholic beverages, and for other industrial purposes, to be reduced.

The use of starch for the manufacture of alcohol for technical use to be reduced to the plane of "important uses of alcohol."

Waste in soap to be reduced.

Domestic animals to be reduced in number by slaughter to that number which can be fed on domestic feeding stuffs, the meat thus secured to be conserved for future use.

The prohibition of feeding bread grains to animals.

Regulation of feeding of potatoes to animals.

Reduction of number of milch cows to plane of necessity; no milk to be fed to swine.

Regulation of use of oats and barley in feeding animals.

Control of use of sugar beets as fodder.

Equal distribution of foodstuffs to all.

In reading the report of the Eltzbacher Commission one is impressed with the fact that the commission was composed of competent and conscientious men, who acted high-mindedly and solely in the interests of the consumer. They had, in a manner that was regarded as drastic, recommended the slaughter of one-tenth of the milch cows and one-third of the swine, in order to reduce the number to the plane of feeding stuffs of domestic origin. This ran counter to the interests of the agrarian classes.

Nevertheless, this was done. The recommendations of the commission for the control of bread grains were also placed in effect, and the entire people placed upon a bread and flour ration. From this point on, it was apparently assumed that the people would follow the recommendations of the scientists; it was assumed that producers and tradesmen would carry out recommendations designed to protect the consumer. Had the producers, tradesmen, administrators and politicians of Germany exhibited the same high-mindedness, foresight and regard for the consumer that was evident in the investigations of the scientists, the crucial problem of the nutrition of the industrial classes—which has been second in importance only to the military situation, or possibly equal to it—would never have arisen.

The Three Generals

There is a fable in Russia to the effect that three generals protect Russia from invasion: General Cold, General Distance and General Swamp. The three generals directing the attack on the nutrition of the German people were General Blockade, General Crop-Failure and General Mismanagement; and a review of the situation leads the impartial observer to the conviction that General Mismanagement was not subordinate to the others.

The recommendations of the scientific commission were directed at the problems of production and distribution in the interests of equitable consumption, even at the expense of the commercial interests of the producer and distributer. Though it was important that the producer should continue to find production profitable, it was of greater importance that each individual in Germany should possess a diet sufficient to maintain nutrition. If foodstuffs should be wanting, it was important that the lack be shared by all classes.

After the war had gotten under way, the disquieting fears of scientists were discounted by the public. The average German regarded the war as a promenade to Paris, just as the average Russian looked upon it as a procession to Berlin. Even the entrance of Great Britain awakened no serious apprehensions. With Belgium and France conquered by German arms and the Balkans under subjugation by Austria-Hungary, whatever Great Britain might do could lead to no serious consequences. The capture of large amounts of foodstuffs in Belgium and France was not without influence on the public—meat, 440,000 tons; potatoes, 650,000; flour, 400,000; bread grains, 670,000; butter, 55,000; and other foodstuffs over 500,000 tons.

Faith in the army inculcated an optimism that permeated every tissue of society. The crops of 1914 were only fair, but excellently garnered, despite the war. The check upon the Marne was regarded as a temporary lull; after the winter the march to Paris would be resumed. The report of the Eltzbacher Commission was issued just before Christmas, and appeared upon a scene of Christmas activities that was probably rarely surpassed in Germany. Not only did the civilians celebrate Christmas with all manner of eating and drinking, but the holiday delicacies sent to the front embarrassed the postal service.

When the government permitted the exportation of twenty-five hundred carloads of grain to Switzerland, and later granted permission for the exportation of a million tons of sugar (headed for Great Britain!) these relaxations were interpreted by the people as evidence of the splendid state of German food supplies, despite the protests of scientists and statisticians. The warning of the Eltzbacher report that if the per capita consumption of food continued at the customary figure of ninety units, when only fifty-six were needed and only sixty-seven were available, the supply would soon be reduced from sixty-seven to below the needed fifty-six, was seriously received by one class alone, the Social Democrats, who, as a

Glimpses of Tire Service given FREE at any of the more than 125 Fisk Branches

Inspecting

Dismounting

Assembling

Air Testing

What *Is* Tire Service?

FREE TIRE SERVICE should include the changing of tires, mounting spares on rims or wheels, inflation, the testing of air pressure and wheel alignment, and regular, frequent inspection.

To be complete, and completely free, this SERVICE must be available to every man who drives a car, regardless of the make of the tire he uses.

Add the intangible but equally important details of SERVICE, such as training, courtesy, consideration and intelligent care for the small things that may so easily make or mar pleasure in business dealing, and you have FISK FREE SERVICE.

SERVICE—real SERVICE like FISK—cannot be established in a week or a month or a year.

To decide to give SERVICE is one thing, to give it is quite another. It takes time to perfect an organization in the spirit of SERVICE.

From the moment one enters the employ of The Fisk Rubber Company, he sees, hears and is trained to think SERVICE. His associates are interested in his initiation into the FISK way of doing business. This spirit can come only after years of effort and continuation of the original members of a company and organization in the work.

Therefore, we say advisedly that FISK SERVICE is built to a policy. It is the product of years of growth, founded on the basic ideal of making the entire FISK organization a power in the development of satisfaction in motor car use.

Digitized by Google

to TIRE USERS

Moreover, this is direct and uniform SERVICE, given by FISK employees through local FISK branches and service departments in principal cities throughout the United States.

The value and the scope of FISK FREE SERVICE to dealer and tire user, alike, cannot be over-estimated. To the direct benefit of each of them is the fact that with all its attained superiority FISK SERVICE *is offered to Everyone Free.*

Regardless of what tire he uses, a man may drive to any FISK Branch, and without any purchase and without any obligation, he may take full advantage of the exceptional FISK facilities and unique SERVICE policy.

When you get an offer of actual SERVICE for nothing, from a reputable company, it is good business to take advantage of it.

Keep this thought with you! You need not use nor buy a FISK tire in order to enjoy FISK FREE SERVICE. The sooner you get the habit of accepting it, the quicker you will reduce your tire expense. The biggest average mileage on tires is shown through those branches where the most SERVICE is rendered. This is according to actual record and is of the utmost significance to car owners.

Be fair to your tires. Give them the chance offered by expert care and inspection and they will amply repay you in economy and convenience.

THE FISK RUBBER COMPANY
Of N. Y.
Chicopee Falls, Mass.

E. H. Broadwell
Vice-President

8 Bears with 9 Shots

"I have tested the .250-3000 Savage I got from you last Spring on eight head of bear without a miss, and only shot one of them the second time."

Letter from Mr. James R. Gill, Cascade, Idaho.

Write us for a description of the rifle he used. Price $32.50; cartridges $5.70 per hundred. Gun dealers everywhere will be glad to show you this

.250-3000 SAVAGE

SAVAGE ARMS COMPANY, 72 Savage Avenue, UTICA, NEW YORK

(Continued from Page 61)

class, have proved themselves the most objectively thinking class in Germany. The agricultural population did not concern itself in attempting to measure how far its produce would reach into the industrial population.

The classes of larger means in the cities had faith in the buying power of money. "Each one should cut down; but, since so many others are cutting down, mine will not be missed." The control of bread grains and their products and the reduction in livestock were the only enactments of serious value put into force during the first year of the war. The harvest of 1915 was far below the normal in grains and the sugar beet, though the potato crop was a record crop.

The summer campaigns on the West Front were without decisive results, and convinced the mass of Germans that the capture of Paris had become very improbable. The capture of large areas of territory in the East yielded little booty in food supplies, as the Russians destroyed ruthlessly in their retreat, and had earlier in the year ruined the crops in considerable sections of East Prussia.

The advent of Italy into the war closed one door through which large stocks of supplies had entered. The entrance of Bulgaria and Turkey removed those countries from the position of benevolent neutrals to allied belligerents, who had to conserve their own food supplies for the state of war; as a matter of fact, when Bulgaria and Turkey declared war they became military aids but economic burdens, and the loss of their excess supplies was one of the prices the Central Powers paid for their military allegiance.

Two measures of conservation were enacted during the first year of the war: (*a*) All grains were declared subject to confiscation; the bread grains were reserved for human consumption; a bread ration established; feeding of bread grains to domestic animals was prohibited. The utilization of bread grains for industrial purposes was restricted; the use of barley for the manufacture of malt was reduced one-third; the oats were confiscated for the use of the army and work horses, and the feeding of barley and maize placed under a general regulation.

Unfortunate Waste

This was, in part, a paper regulation only; the grains were subject to confiscation, and such quantities as were needed, weekly or monthly, were taken possession of; but the grains that lay with the producers were not held in reserve in the same manner as though they had been impounded in government warehouses. The millers were instructed to mill rye flour to eighty-two per cent of the grain and wheat flour to eighty per cent of the grain. The flours thus obtained were somewhat more nourishing than the finer bolted flours of peacetime, and the yield in flour was, of course, materially greater; but the lessened residue in grain offal for feeding purposes was a disadvantage, since the fodder calculations had been based upon the normal production of grain offal.

The peacetime consumption of rye and wheat, in the proportion of about two to one, was about one pound a head a day—higher in Bavaria, lower in North Prussia. The bread and flour ration of the empire, fixed in the winter of 1914–1915, was equal to one-half of a pound of flour, which was much less than the flour ration of peacetime. Though ostensibly the bread card was imperial and supposed to be uniform in all portions of the empire, this was not strictly the case; in particular, considerable leeway was allowed in the purchase of flour in different portions of the country.

(*b*) The recommendations of the Eltzbacher Commission for the reduction of swine and cattle were carried out during the first four months of 1915. Approximately one-third of the swine and ten per cent of the milch cows—supposedly about a million and a half—were killed. About the time when the killing of the swine was under way, in March, an inventory of the potato stocks led to the official statement that these were low. Since the potato in Germany was one of the staple swine feeds, it was decided to kill rather more than the denominated number of swine, in order to meet the loss in potatoes. Two months later another potato inventory was taken, revealing the fact that the previous inventory had been in error and that the killing of the additional swine had been entirely unnecessary, since the potatoes were available; and these potatoes were thrown upon the market at a huge loss in price and to a large extent underwent decomposition.

No oxen were killed and the killing of calves was not in excess of the usual number; the slaughter did not extend to sheep and goats, which, on the contrary, were conserved with foresight. The presence of such huge amounts of meat upon the market unquestionably resulted in increased consumption during the first six months of 1915. According to the plan, by far the largest portion of the meats thus obtained was to be conserved for future use, and should have represented a very large stock of conserved meat. The processes of conservation were, however, carried out very inefficiently, with the result that a large portion of this meat underwent decomposition and became a complete loss.

The crops of the year 1914, though rather low, had been excellently garnered; the sugar crop was in excess of the normal; a great deal of food got in, because of the imperfect blockade; and, all in all, the nutrition of all classes of the German people was practically normal during the first year of the war.

Bread Regulations

Preoccupation with military affairs, aided by the tacit assumption that the campaign of the summer of 1915 would terminate the war, resulted in inadequate preparation of the soil for the crops of 1915. There was a definite lack of fertilizer. The basic slag produced in the mills was not sufficient in quantity to cover the phosphate needs of the fields that had always been dependent to a large extent upon soluble phosphate imported from the United States and elsewhere. Potassium, in various forms, was, of course, available in unlimited amounts.

Nitrogen, as nitrate, ammonia or cyanamide, was scarce. The plants devoted to the synthesis of nitric acid, ammonia and cyanamide were small; the conditions of successful manufacture on a large scale had not been worked out and the demands of the military authorities for nitric acid exceeded all expectations. The result was that little nitrogen was available as fertilizer for the soil, and the soil of Germany is directly dependent on fertilization for the production of each crop.

In addition, the season was not favorable; the temperature was low and there was a long period of drought at a time when the grain required rain. The result was a low yield in all grains, in hays, in sugar beets, but with a record crop of potatoes. The acreage of sugar beets had been reduced to about three-fourths, of which the yield was about four-fifths. The total grain yield of 1914 was nearly four million tons lower than in 1913; but the yield of 1915 was five million tons less than the crop of 1914. Four hundred thousand tons had been set aside as reserve for the army.

When the quantities allotted for the flour ration, plus the amounts devoted to industrial uses and reserved for seed, were subtracted from the known amount of grain available from the crop of 1914, there remained some three million and a half tons of wheat and rye to extend over into the new year. But when the inventory of the crop of 1915 was made, this grain had disappeared. During the first winter of the war the use of the potato was made obligatory in bread. Wheat flour had to be used with ten parts of potato, and, also, later contained from ten to twenty parts of rye flour. The regulation rye bread contained ten per cent of potato starch. If the bread contained more potato—from ten to twenty per cent—it was called "K" bread; if it contained still more potato—twenty to thirty per cent, or even more—it was called "K K" bread.

During the first part of the war the consumption of bread occurred largely in the form of the best rye bread. The disappearance of over three million tons of rye and wheat was not only a surprise, it was naturally a great disappointment.

The importation of grain in the two years before the war was between sixteen and twenty per cent of the domestic production. The agrarians had less grain of their own raising; they were denied the normal amount of domestic grain offal by the new milling regulations, and the blockade excluded the grain previously imported. This created for the agrarians a dilemma, despite the reduction in cattle and swine; and this dilemma they solved by the simple

Digitized by Google

procedure of feeding the excess of grains that had been made liable to confiscation, on paper, but had, in fact, been allowed to remain in the possession of the producers.

The low crop in sugar beets brought with it, also, another ominous revelation—namely: that the sugar supply of the previous crop was exhausted. The average sugar production for the two years previous to the war was 2,700,000 tons, of which nearly 600,000 tons were exported, leaving over 2,000,000 tons crude, or 1,900,000 tons refined. Of the refined sugar 580,000 tons were exported, leaving for domestic consumption 1,320,000 tons, which amounted to two ounces a head a day. At the outbreak of the war Germany had 400,000 tons of crude sugar from the crop of the previous year; the new crop amounted to about 2,600,000 tons, so that the huge stock of 3,000,000 tons was available to the German people, under the assumption that none should be exported.

To the amazement of scientists, the government, in October, 1914, gave permission for the exportation of 1,100,000 tons. The object of exportation was explained as fulfilling three purposes: it complied with the wishes of the powerful syndicate of sugar refiners; it gratified the importunities of the surrounding neutral countries; and it raised the rate of exchange. The yearly demands of Holland, Switzerland and the Scandinavian countries were not over one hundred and fifty thousand tons of sugar a year; the remainder was headed for the French and British markets. And this was made clear in the energetic protests that were made to the government.

Regulations for the control of the utilization of sugar-beet residue, molasses, crude and refined sugars for food, fodders and industrial uses, were established late in the fall of 1914. These did not include physical confiscation, but did include authorization of control. In order to provide larger supplies for livestock, recovery of refined sugar from molasses was prohibited. During the winter of 1914–1915 the consumption of sugar was much above normal. Very large amounts were consumed in the army, also in hospitals; and apparently the people in general used sugar with unusual freedom.

To what extent the total available sugar was diverted from human to animal consumption cannot be stated, since the sugar beets were not under accurate statistical control. It does not seem probable that the consumption of sugar by each individual could have been in excess of three ounces a day, in terms of crude sugar, which would have amounted to 1,900,000 tons, leaving some seven hundred thousand tons for industrial and feeding uses after the half million tons allotted to exportation were subtracted. All in all, the fact remains that when the sugar-beet crop of 1915 was brought in, the sugar of the previous year was practically exhausted.

In the autumn of 1915 two meatless days—Tuesday and Friday—and two fatless days—Monday and Thursday—were introduced. And this was within six months after one-third of the swine and a million and a quarter of milch cows had been killed!

Maximum prices were placed to control the retail sales, again without correlation and usually without result. Gradually the lines became drawn between the cities and industrial districts, on the one hand, and the country districts, on the other. In order to protect themselves, the country districts went to the length of establishing prohibitions of export.

The authorities attempted in a half-hearted manner to oppose such regulations and to reëstablish the flow of foodstuffs in the channels of trade by increasing the maximum prices; a maximum price once established became, of course, the only price. As opposed to the regulations of the cities and of the imperial authorities, the regulations of the smaller districts were naturally more effective.

A veritable pestilence of restrictive regulations spread over the entire land; and, since it was community against community and the devil take the hindmost, it was soon made apparent that the industrial cities were hindmost.

It was clear that, whatever influence the report of the Eltzbacher Commission might have had, as applied to the consumer—and such was certainly not strongly in evidence—the letter and the spirit of the recommendations were ignored by the producers and the middlemen.

Editor's Note—This is the first of three articles by Doctor Taylor. The second will appear in an early number.

THE STUDY OF FOOTPRINTS

(Concluded from Page 13)

they were able to demonstrate by actual experiment that blows on the sheet-iron sides of the vault would reverberate through the courthouse like the boom of a bass drum.

One of the best examples of typical criminal investigation in this country is Nordall's case, in Montana.

The theater of this tragedy was in the cattle country on the Musselshell River. The scene of the crime showed two distinguishing clews, clearly defined and capable of exact examination. They were, in fact, examined by a number of persons several days after the date of the tragedy. These criminal evidences consisted of the footprints of a man in the soft earth leading from the residence of the victim to a storehouse some distance away, back again to the house, and from there to the river. The second clew was the track of a horse, which could be followed for some distance, leading away from the Musselshell River.

The footprints of the man and the tracks of the horse were clearly imprinted and contained distinguishing characteristics which should have enabled any intelligent investigator to identify both the man and the horse.

The persons who discovered the footprints saw nothing strange about them. Four or five days later some witnesses for the state examined these footprints. They thought there was "something peculiar" about them, but did not know what it was. But later on, with a number of other persons, they measured the tracks, marking their length and width upon sticks. It is significant to notice that even these crude measures were not produced at the trial. The witness who made them said he had not kept the sticks because the prosecuting attorney told him it was not necessary to keep them!

That was about the extent of the examination of the footprints, except that somebody among the number of persons who visited the place finally discovered that the man who had made the prints had been wearing overshoes.

The examination of the horse's tracks was even more careless, if possible. The witnesses who knew something about horses looked at the tracks and said that the hoof mark was queer. They thought it had been made by a horse named Nig, which belonged to Nordall. They tracked the horse pretty cleverly, located the place where the assassin had left it standing while he walked from the river to the house, and followed the trail where the horse had gone in the direction of Nordall's ranch.

There the matter ended. Nothing was done to show the court in what manner the tracks were queer, or how they resembled the track of Nordall's horse.

Upon such an examination of marked distinguishing clews the assassin never could have been located or convicted. It happened, however, that there was an abundance of physical evidence indicating Nordall as the assassin. Among other things the authorities found at his house a pair of overshoes. Both of these overshoes were for the left foot. It was then discovered that the "something peculiar" which the witnesses had noticed in the footprints was that they had all been made by what appeared to be a left foot—that is to say, by some one wearing a left overshoe on each foot. See Figure 10.

An examination disclosed that there was frozen blood on the bottom of these overshoes, between the heel and the sole. The overshoes were given to an analytical chemist to determine whether the stains were human blood. And, to add to all the other amazing inadequacies in this example of criminal investigation, the expert testified at the trial that he was unable to say whether or not the blood on the overshoes was that of a human being!

Is it any wonder that European authorities dismiss the subject of criminal investigation in this country with the single condemnatory sentence:

"Crude, unscientific and careless!"

Author's Note: See Gross; Zenker; Shauenstein; System der Kriminalistik, for diagrams.

ACME RAPID FIRE and 1900 BATTERIES

FIRST -because they LAST

How to Save Battery Bother

Dry Batteries that do their work well and last long without requiring attention are important. They prevent bother.

You get maximum service with the least possible trouble through the use of ACME BATTERIES.

If you want batteries for ignition be sure to buy the ACME RAPID FIRE. It's our *special* ignition battery and is a sizzler!

For telephone and general service, including ignition, the ACME 1900 is a *strong* favorite because of its long life.

The manager of a South Dakota telephone company writes us that he has a number of ACME 1900 Batteries which have been in use more than seven years. Can you beat it?

ELCAR

For Beauty and Quality
The Elcar at $845

THERE are few cars equally beautiful at any price, and few, if any, equally good at as low a price. We put into the ELCAR the style, class and high-grade workmanship that went into our former models selling up to and above $3,000. Our organization has had long training in the production of quality cars, and both beauty and quality are inherent in the

A Few Elcar Specifications

Wheel Base—As long as some cars selling up to $3,000 and more—115 in.
Motor—4 cylinder; long stroke; high speed; 34.7 h. p. at 1,800 r. p. m.
Fuel Supply—Stewart vacuum system.
Ignition—Delco automatic spark advance with manual control.
Starting and Lighting—Dyneto two-unit; double-bulb headlights; Willard storage battery.
Clutch—Dry multiple disk—seven plates, steel on Raybestos.
Rear Axle—Full-floating with roller bearings at each end of wheel hubs.
Differential—Spiral bevel driving gears, with roller main bearings and ball thrust bearings.
Brakes—Internal and external, two inches wide on 12-inch drums.

Three New Models at $845

Five Passenger Touring Car
Four Passenger Touring-Roadster
Two Passenger Roadster

Each model is large and roomy—some would say room to spare, but you want a car that will seat its full load comfortably. Fine in appearance, fine driving and remarkably easy riding qualities, power in excess, economical in upkeep and fuel consumption, a car to give you satisfactory service for years to come—a car that we believe to be as high in quality and as nearly mechanically perfect as any car ever offered at an approachingly low price.

Our Illustrated Catalog

will show you views of all the ELCAR models and the more important mechanical parts, and is descriptive even to the minute details of construction. We will gladly mail it to you upon request.

Millions in Extras

Unique to Mitchells—Paid For by Efficiency

Go measure up what the Mitchell extras mean. There are hundreds of them—weigh their value to you.

Then remember that each represents a factory waste which John W. Bate has saved.

These extras cost us millions of dollars. They would be utterly impossible at Mitchell prices under old manufacturing methods.

It is hard to grasp, in the abstract, the value of efficiency. Here you will see the countless results embodied in a single car. Here you will find a wealth of attractions heretofore unknown. And the total will amaze you.

Go see what these Bate methods mean to you, before you decide on a car.

The Double Strength

The latest extra—first announced this year—is 100 per cent over-strength. Our former safety margins have been doubled in three years. All important parts are twice as strong as need be.

That means oversize parts made of costly steel. It requires much Chrome-Vanadium. Over 440 parts are made of toughened steel.

The difference doesn't show now. It may not show for years. But we adopted this extreme standard after 12 years of car building. So you may know you need it in a lifetime car.

Some Radical Tests

The Bate cantilever springs used now are tested for months in our factory. The tests mean more than years of road use. Yet not one Bate spring has broken.

We have used those same springs for two years now, on tens of thousands of cars, on millions of miles of road. Not a single one has broken.

For safety's sake, our steering parts are now vastly oversize, and built of Chrome-Vanadium.

Our gear teeth now are required to stand a pressure of 50,000 pounds.

As proof of endurance, two Mitchell cars have run over 200,000 miles each—full 40 years of ordinary service. Seven that we know of have averaged 175,000 miles each.

TWO SIZES

Mitchell —a roomy, 7-passenger Six, with 127-inch wheelbase. A high-speed, economical, 48-horsepower motor. Disappearing extra seats and 31 extra features included.

Price $1460, f. o. b. Racine

Mitchell Junior —a 5-passenger Six on similar lines, with 120-inch wheelbase. A 40-horsepower motor—¼-inch smaller bore than larger Mitchell.

Price $1150, f. o. b. Racine

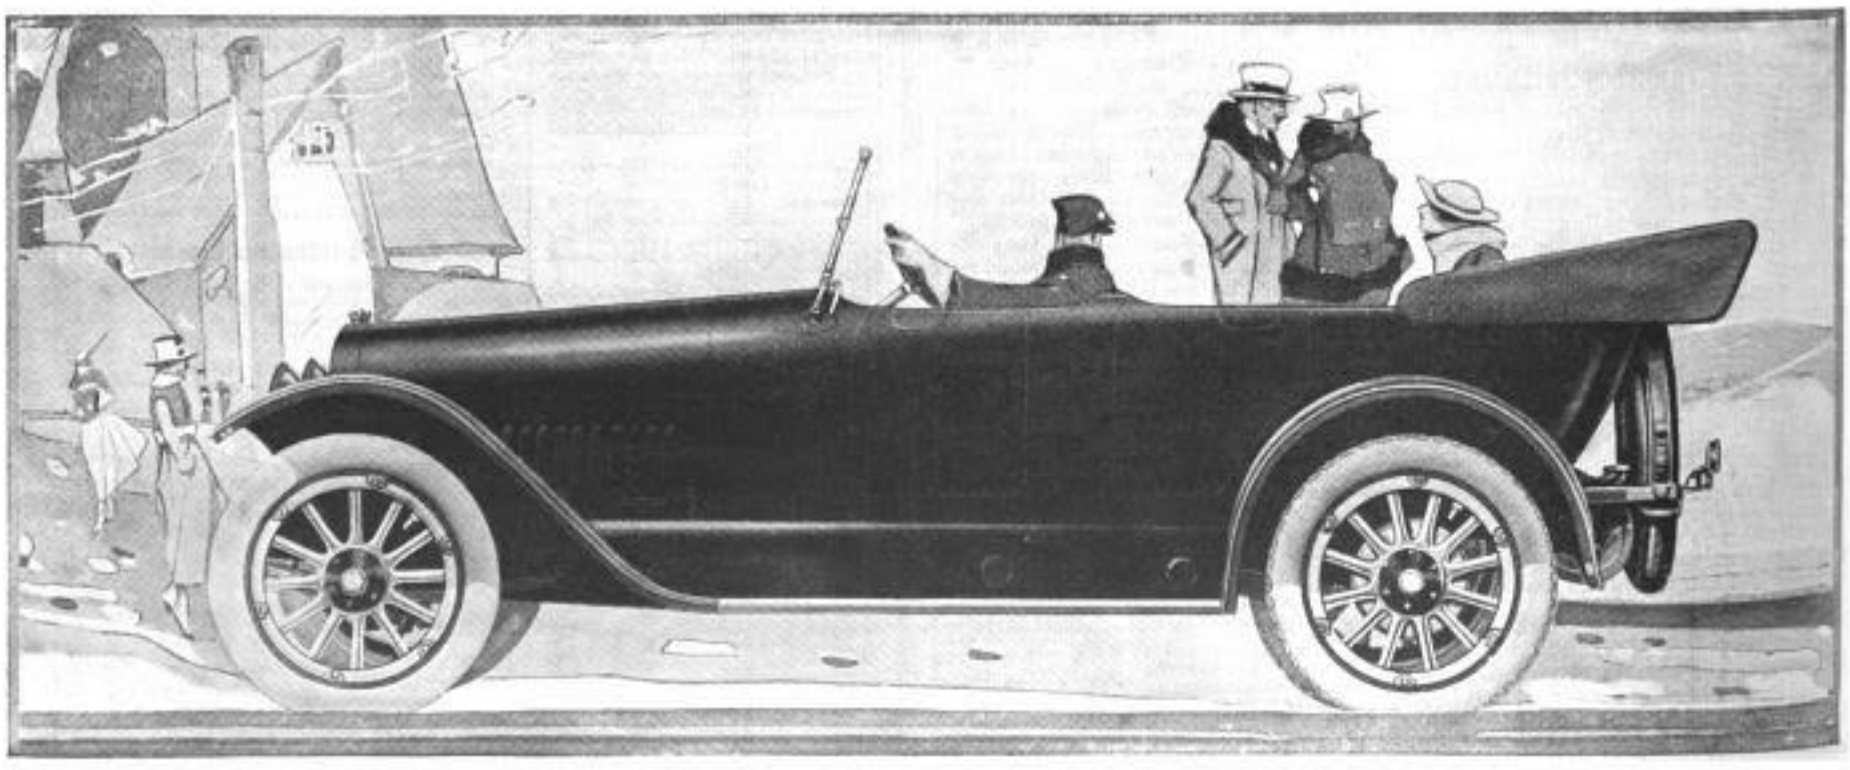
Also all styles of enclosed and convertible bodies. Also demountable tops.

The Extras You See

You see in the Mitchell 31 extra features, which nearly all cars omit. Things like a power tire pump, reversible headlights, a ball-bearing steering gear, an easy control, a dashboard engine primer. You see a light in the tonneau, a locked compartment for valuables, a tool box under hood.

These 31 extras, on this year's output, will cost about $4,000,000. Yet they form but a minor part of the Mitchell extra value.

New Luxury This Year



Our new body plant will this year save us a vast sum more. This all goes into extra luxury. It makes the Mitchell the handsomest car you see.

The finish coats are now fixed by heat in enormous ovens. This gives a deep, enduring lustre which almost nothing can affect.

We are using an extra-grade leather. Also new deep cushion springs which cost 50 per cent more than others. The rear seat is wider. We have added a total of 24 per cent to the cost of beauty and comfort.

This is a new, conspicuous extra. And it results directly from the savings our new body plant creates.

Mitchell SIXES

Two Sizes
$1150-$1460
F. o. b. Racine

A New Size—$1150

Offers You Choice of 2 Sizes and 8 Body Styles

Here is John W. Bate's idea of efficiency applied in another way.

The larger Mitchell—127-inch wheelbase—is required for a roomy, 7-passenger car. And to drive it loaded, under all conditions, requires a 48-horsepower motor.

But many men want a 5-passenger car. A 120-inch wheelbase gives ample room, and a 40-horsepower motor is sufficient. That is more room and power than usual, as you know.

So we now make a Mitchell Junior. This year no one needs to pay for room or power not needed.

Both are Sixes—both typical Mitchells. Both are generous models. Both show equal over-value. And, to prove their sufficiency, 2500 Mitchell Juniors have already been driven six months.

John W. Bate Creates a New Factor

The latest Mitchell models typify a new idea in fine cars. Factory efficiency has been applied to cheap cars, and with marvelous results, as you know. Here you see it applied to quality cars, and to the very limit.

John W. Bate, the great efficiency expert, has spent years to attain this result. He has traveled widely—including a year in Europe—to gather ideas from others.

He has spent millions of dollars to build and equip this model Mitchell plant. Every machine, every operation has been adapted to build this one type economically.

He has kept on, until 98 per cent of the Mitchell car is built under his methods here. He has succeeded in cutting our factory cost in two.

He has used all these savings to make the car better and to make it a lifetime car.

Don't Overlook Them

Don't overlook these vital factors when you come to choose a car.

You will see here standards which sometimes bring $1,000 more. And they are worth whatever price they cost. But you find them here at Mitchell prices because of John W. Bate.

Mitchell Models

The Mitchell is built with eight styles of bodies—

Touring Car	4-Pass. Cabriolet
Roadster	Convertible Sedan
Coupé	Demountable Top
Limousine	Club Roadster

Mitchell Junior **is built with Touring Car and Roadster bodies only.**

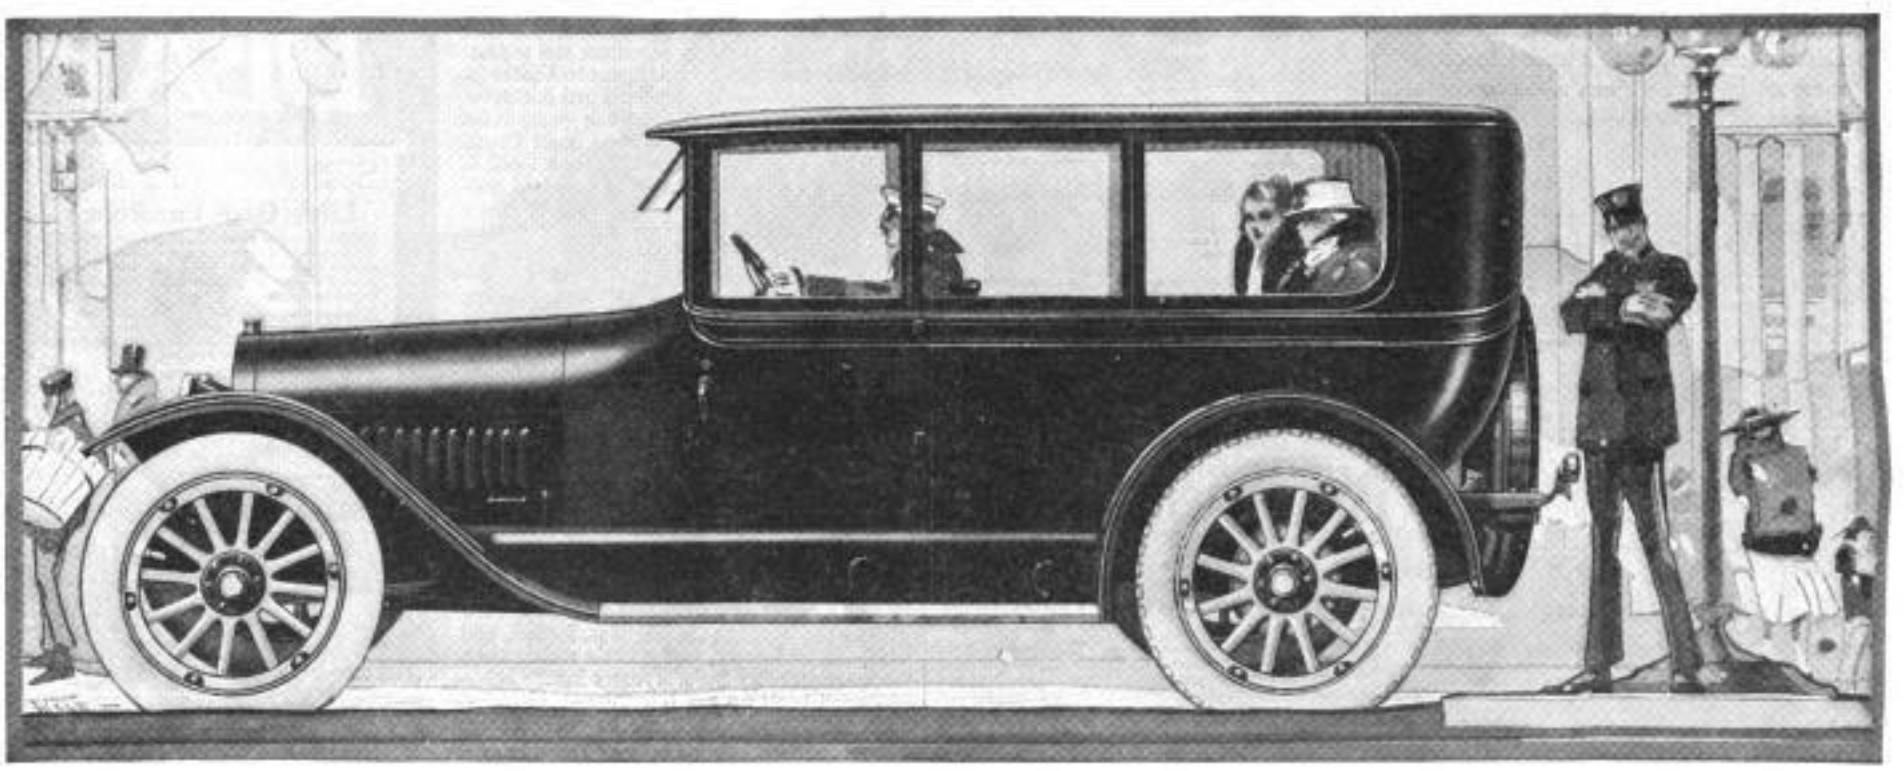
Quoted prices, of course, apply only to open models.

You will find exclusive features—dozens of them—which you know a car should have. But, without factory efficiency, they would make the car cost too much.

Will you let wrong methods deprive you of them? Will you pay an extra price to get them? Or will you get them in Mitchell cars?

Demand Has Doubled

These facts will show the answer given by legions of motor car buyers.



Last year—the Mitchell's 14th year—the demand for Mitchells doubled. This year we have multiplied our factory capacity by 2½ times.

The Mitchell used to be known as "The Engineers' Car," because so many great engineers bought it. It is now becoming the average man's car, because more men are finding it out.

It will be your choice for over-strength, if you consider the years to come. It will be your choice for beauty at a glance. And the extra features are things that you will want.

See them at your nearest Mitchell showroom. See them before the spring demand creates a waiting list.

What 15c Will Bring You from the Nation's Capital

The little matter of 15c in stamps or coin will bring you the Pathfinder 13 weeks on trial. The Pathfinder is an illustrated weekly, published at the Nation's Center, for the Nation; a paper that prints all the news of the world and that tells the truth and only the truth; now in its 23d year. This paper fills the bill without emptying the purse; it costs but $1 a year. If you want to keep posted on what is going on in the world, at the least expense of time or money, this is your means. If you want a paper in your home which is sincere, reliable, entertaining, wholesome, the Pathfinder is yours. If you would appreciate a paper which puts everything clearly, fairly, briefly—here it is. Send 15c to show that you might like such a paper, and we will send the Pathfinder on probation 13 weeks. The 15c does not repay us, but we are glad to invest in new Friends. The Pathfinder, Box 98, Washington, D. C.

CAPPY RICKS, WHEAT BARON

(Continued from Page 22)

"Publicity! We'll tell all we know to the bears. The bulls will get panicky; the bears will take heart of hope, and with Number One white Australian wheat they'll beat the brains out of the market and in all probability kick it down to $1.85, at which figure we promptly buy as much wheat as we have previously sold. Thus we cover our shorts, and the difference between $1.89½ and $1.85, less brokerage and interest—if any—will be, roughly speaking, four cents. Four cents on a quarter of a million bushels is ten thousand dollars—not a great deal, truly, in these days of swollen fortunes, but, nevertheless, a nice piece of velvet—eh, Cappy, you sporty boy?"

"It isn't so much the money we make," Cappy replied sagely. "It's the fun we have making it, my boy; the joy of putting over a winner. The instant a man begins to love money for money's sake he's a knave and a fool. Kill him! But—er—ahem—as you say, my dear young friend, ten thousand each is not to be—er—sneezed at."

"Then you're coming in on the deal?"

"I should tell a man!"

After the fashion of the West they shook hands on it and went to luncheon together at the Commercial Club.

III

DIRECTLY luncheon was over and Cappy Ricks had returned to his office, J. Augustus Redell moved into action. He called on Messrs. Ford & Carter, talked the situation over with them, and showed them where they, having the necessary tonnage in hand with which to guarantee delivery, could bring a couple of million bushels of fine Number One white Australian wheat to the Pacific Coast, cut the price a cent, and doubtless unload every kernel of it at a fair profit. There was every probability that wheat would go to two dollars. For his part in producing this profit Mr. Redell desired a commission of five per cent on all sales of wheat imported in the bottoms he had under option and which he stood ready to turn over to Ford & Carter without profit, since the owners of the vessels would pay him the customary broker's commission on the freight money earned on the voyage. Ford & Carter said they would think the matter over; so Mr. Redell tactfully withdrew, stating that he would call up the following day for an answer.

He knew Ford & Carter would promptly dispatch a long cablegram to their agent in Australia, instructing him to get a forty-eight-hour option on the wheat, with a guaranty of delivery to the vessels as they arrived from time to time. Meantime Ford & Carter would quote every milling company in the West, subject to prior acceptance and their ability to deliver Number One white Australian wheat at a price that would be of interest. If the milling companies accepted this rather nebulous quotation and telegraphed orders, and Ford & Carter's Australian agent could purchase at a satisfactory price the wheat to fill these orders, then Ford & Carter would make formal acceptance and purchase the wheat. If, on the other hand, their agent in Australia failed to get the wheat, then Ford & Carter had an "out" with the milling companies who desired to buy the wheat from them, and the entire matter was off, with Ford & Carter merely out a couple of hundred dollars in telegraph bills. That was the bet they had to make to put their fortune to the touch; and right cheerfully did they make it.

J. Augustus Redell gave them all the time he could. His forty-eight-hour options on the vessels then en route to Australia had cost him nothing; that was a courtesy which one shipowner always extends to another, free of charge, unless the vessel happens to be on demurrage at the time the option is given. When his options were within two hours of expiring he called on Ford & Carter.

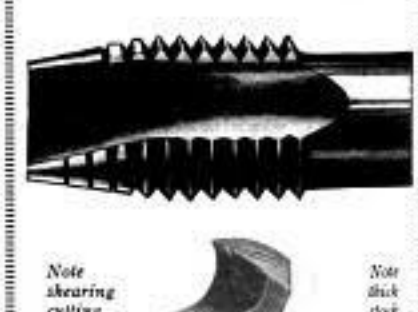
"We'll take 'em all," Carter almost shouted at him. "They'll be arriving with sufficient time elapsing between arrivals to guarantee us immunity from any undue delay or embarrassment in loading them. We've bought the wheat and sold it; now give us the tonnage to freight it, Redell, and we'll all be happy, and a little richer than we were the day before yesterday."

Redell took up the telephone and called each shipowner, in turn, to inform him

(Continued on Page 70)

GTD

America Is Famous For Better Tools



A great part of America's reputation for making superior machinery rests on American toolmakers. No more momentous improvement in tools has ever been made than in the design of the Gun Tap shown below. In one step the tap has been changed from a continually breaking, expensive trouble-maker to an efficient, modern tool.

The Gun Tap is first the tap that *wears out before it breaks*. (90% is the usually accepted figure for breakage with ordinary taps.) Then it is the easiest cutting tap, and the first type to cut correctly—with a shearing action. It cuts more accurate threads, requires less power, and holds its size longer, than any other type.

Thus the Gun Tap makes possible a production greatly increased in accuracy and quantity.

For further details and reasons why, send for Bulletin on Gun Taps.

It Pays to Have an Expert Repair Your Battery

By the Willard Service Station Man

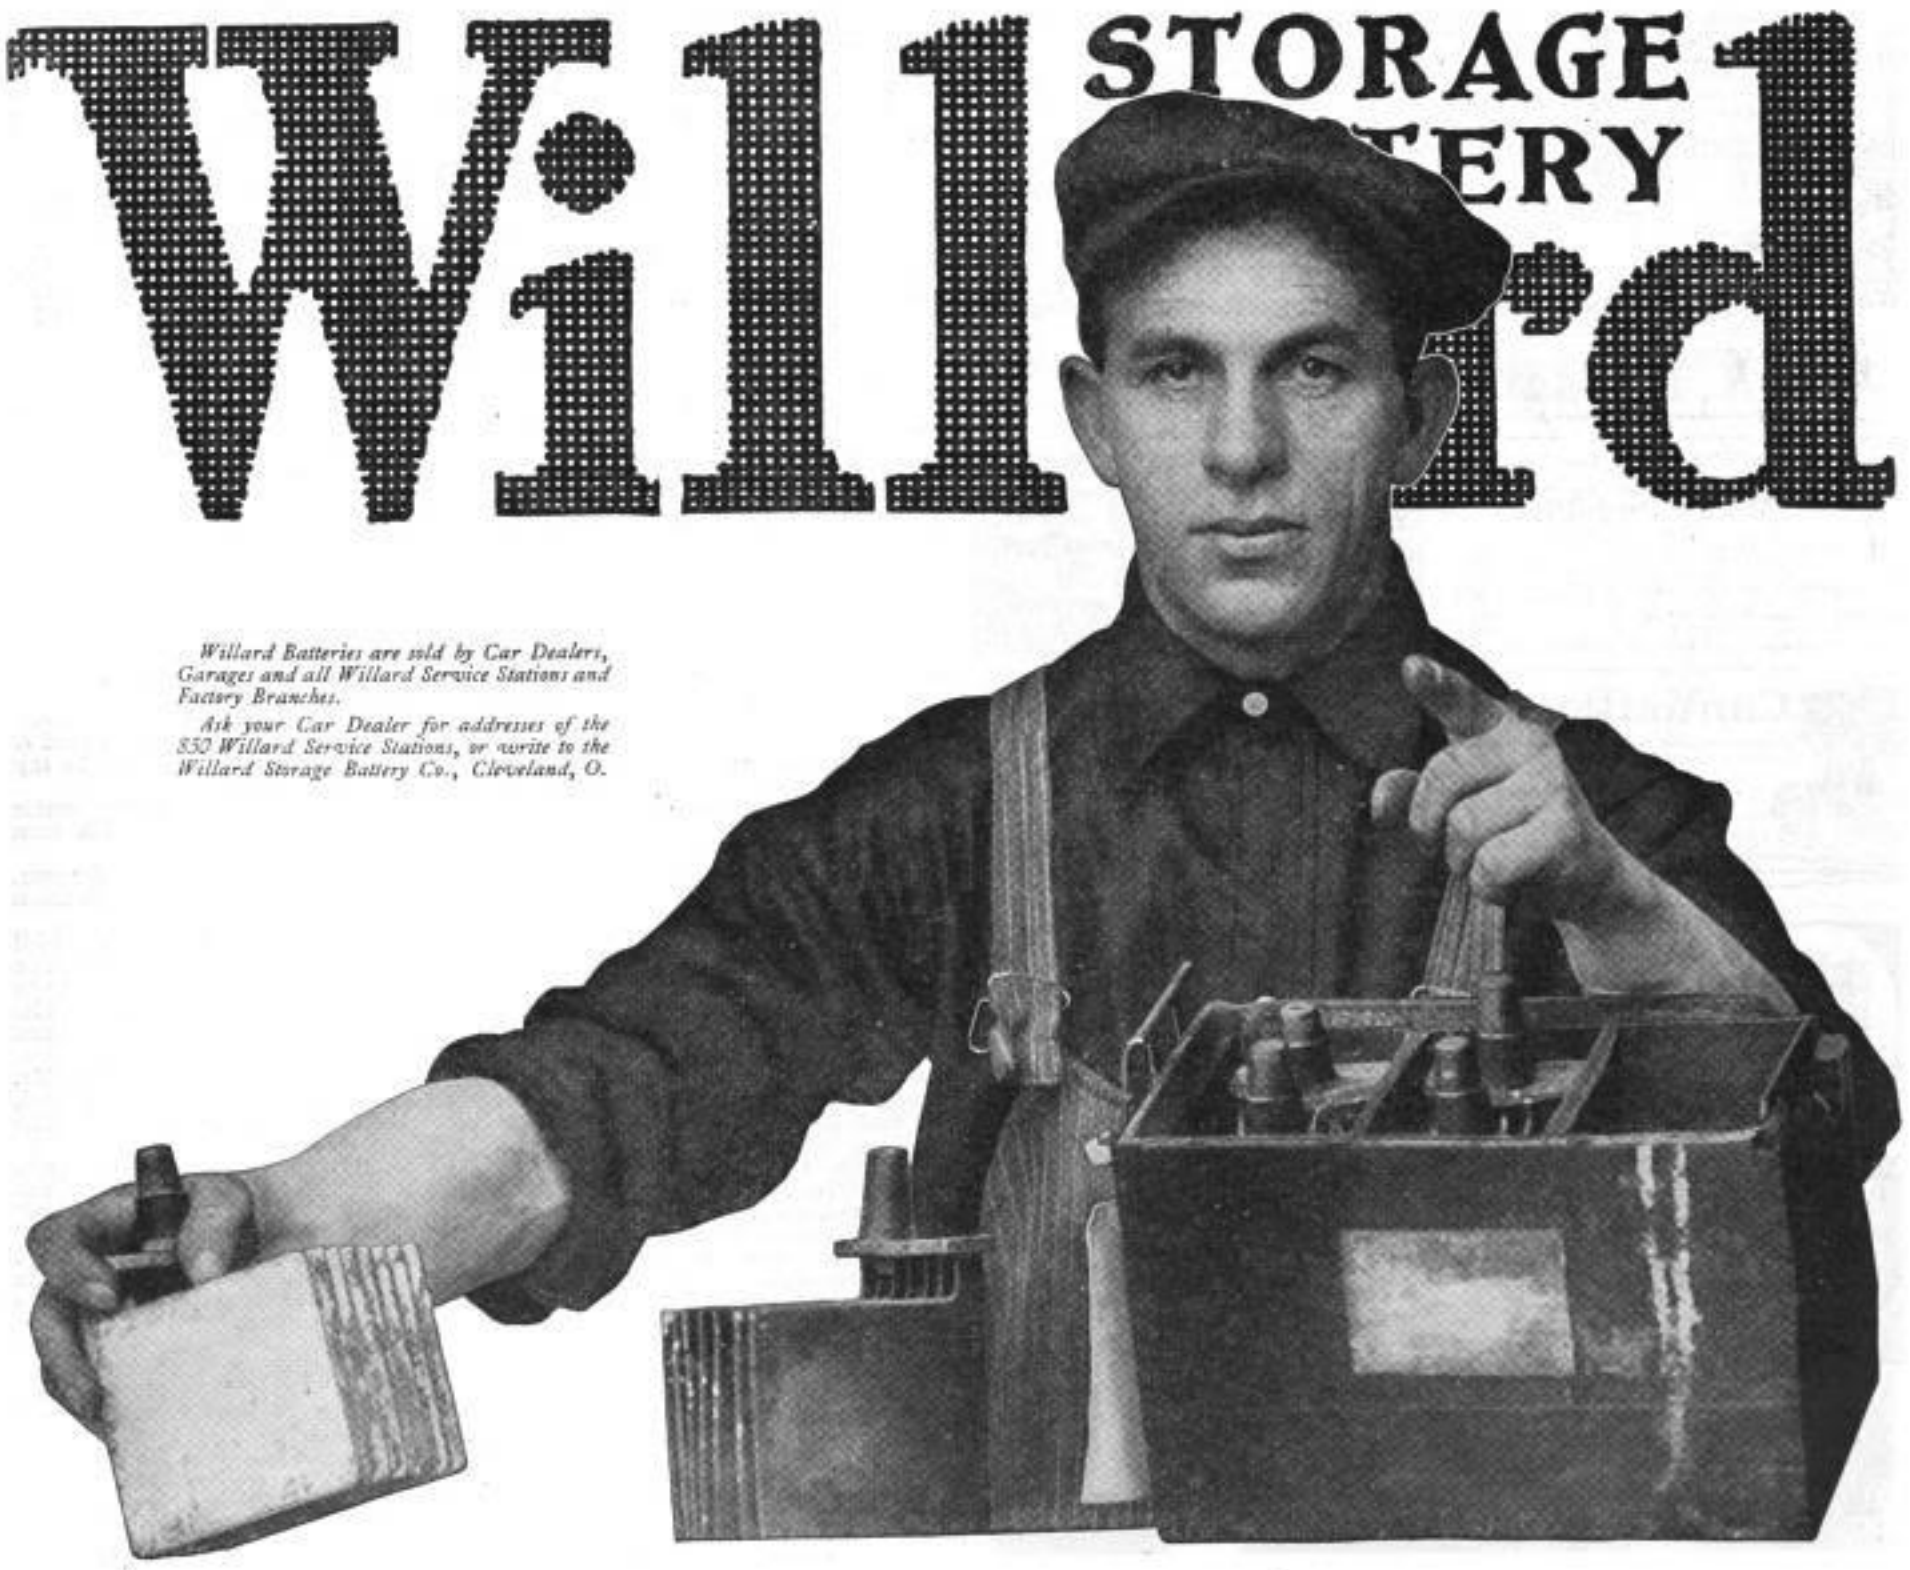
It doesn't pay to repair a tire when it's given you ten to fifteen thousand miles of service—when it is rim-cut and its casing is torn to ribbons.

But when it is merely punctured it *does* pay.

And batteries are like tires—except that a good battery, well cared for, should outlast a set of tires and costs less to begin with.

Sooner or later both batteries and tires wear out and have to be replaced.

But when it's merely a matter of re-insulation or of replacing a single cell it often *is* worth while to repair a battery.



Don't, however, trust it to the judgment of a man who isn't a battery expert.

Better depend on a Willard Service Station to advise you—and also to do the work.

It's our business. We've been trained for it by Willard factory experts, and Willard Service was established to give you the fullest possible return on your investment.

And Willard Service backing up Willard quality is the reason why over a million cars have been equipped with Willard Batteries.

If I find your battery needs to be repaired, I have a rental battery for your use while yours is in the shop.

Willard Batteries are sold by Car Dealers, Garages and all Willard Service Stations and Factory Branches.

Ask your Car Dealer for addresses of the 850 Willard Service Stations, or write to the Willard Storage Battery Co., Cleveland, O.

that he would exercise his option on the latter's ship, and for the owner to prepare charter parties and send them up to his office for signature.

"I will have no difficulty in getting the owners to agree to an assignment of these charters to you," he advised Carter. "You and Ford are brothers in good standing, I take it. However, if they insist on doing business through me, in order that they may hold me responsible, I'll simply re-charter to you at the same rate."

"Lovely!" cried Messrs. Ford & Carter in unison.

Ten minutes later J. Augustus Redell burst into Cappy Ricks' sanctum and wakened the old gentleman from his afternoon siesta.

"The trap is set," he announced. "Come on, Cappy! We're going up to the broker's office now and give the order to sell our December wheat. I can't go alone, you know. There wouldn't be an odor of sanctity about the transaction if I did."

"We'll have Gregg & Co. attend to it for us," Cappy announced. "You remember Harry Gregg, don't you? Used to be in the steamship business years ago. Gosh, that boy knows me! He'll take a stiff finger bet from Alden P. Ricks."

Together they motored uptown to the office of Gregg & Co., where Cappy's card gained him instant admittance to the broker's private office. Redell remained in the anteroom on pretense of speaking to an acquaintance, and the instant Cappy disappeared into Gregg's office Redell stepped out into the hall, where he waited until Cappy had booked his order and came hunting for him.

"Well, I've sold my two hundred and fifty thousand bushels at a dollar-ninety," Cappy announced.

"How much margin?" Redell demanded.

"Oh, Gregg didn't sting me very hard. Ten thousand. It seemed like a good bet to him. He looks for a drop in December wheat."

"Met a pest out here and couldn't seem to get away from him," Redell explained. "Take me in and introduce me to Gregg, and I'll give him an order to sell a jag of wheat for me."

Cappy complied and Redell gave the broker his order.

"It will take about twenty-five thousand dollars to margin this trade, Mr. Redell," the latter remarked easily as he wrote out the order and handed a copy to Redell.

"Nonsense!" Cappy struck in. "Mr. Redell is one of our most delightful, trustworthy and popular young men, and to ask him for twenty-five thousand dollars to-day would prejudice his standing with his banker. I guarantee him, Harry. Treat him as you'd treat me. I guarantee him up to a hundred thousand dollars."

"Your guaranty goes with me, Mr. Ricks," Gregg answered promptly, and shoved the copy of the order he had just booked over to Cappy, together with a fountain pen. Cappy wrote: "O. K. Alden P. Ricks." Redell gave his check for ten thousand dollars margin and the deal was closed. When the scheming pair returned to Cappy's office the latter gave Redell his check for ten thousand to reimburse Redell for margining the trade, in accordance with Cappy's verbal agreement to provide the sinews of war.

"Now then, Cappy," Redell announced as he stuffed Cappy's check into his pocket, "the next move is to return to my office, close those charters with the owners and turn the ships over to Ford & Carter. That matter attended to, I shall, with eighteen charter parties in my pocket, drift casually over to the Merchants' Exchange. There I shall find the market reporters for both of our sunrise sheets; if they are not there I shall wait until they arrive. These gifted young men I shall draw to one side; to them I shall, with great gusto, relate a tale of Number One white Australian wheat, shortly to descend upon the United States of America in no less than eighteen vessels, now chartered for that purpose, with more to follow. In proof of this statement I shall exhibit the charter parties; and then ——"

"Front-page story!" Cappy declared, interrupting.

"Not yet—but soon. To get on the front page a story must be rather unusual. A perusal of our daily rags will convince the most skeptical that the sensational, the unusual, the bizarre are what appeal most to the men who make the newspapers. The unusual thing about our deal lies in the fact that this is the first time in the history of Australia or the United States that the former country has exported wheat into the latter—the first time the latter has ever had to call on an outsider for help. Then, Cappy, it will be a front-page story—and how those boys will hop to it! Why, we'll get a column about Australian wheat invading the land of the free whose rapacity threatens the very food that goes into the mouths of little children! Little children and their mouths is good stuff! I'll use that line when slipping the story to the boys. They might overlook it if I didn't. I'll remind them of the six-cent loaf of bread, the sufferings of the poor, and how far the importation of Australian wheat will go to knock the Chicago wheat barons galley-west."

"Here, here! You're too precipitate," Cappy cautioned. "Don't tip this story off to both reporters. That's coarse work. Tell it to one only. Put him under obligations to you by seeming to give him a scoop. Tell him you won't say a word to his competitor, and he'll tell his city editor the story is exclusive; then they'll be certain to play it up big."

"Cappy, you're a rock in a weary land! Who'll tip off the other reporter?"

"I will, of course. Leave it to me. A man doesn't go through the mill of Big Business without knowing the way of that singularly useful individual, the newspaper man."

Redell sat down and laughed until the tears ran down his merry countenance. Cappy thought the outlook sufficiently cheerful to warrant that laugh and suspected nothing. He even joined in the laugh.

"And to-morrow morning, when that story appears, the local brokerage firms will be calling up Ford & Carter to verify it," Redell continued presently. "Of course it will be verified; then—bingo! the story is wired on to Chicago. It busts, first, in the Wheat Pit and, second, in the afternoon editions. The bears will leap on the market and kick it to pieces; the bulls will get panic-stricken and hesitate about supporting it; all the little fellows who have been going short on December wheat will get cold feet and throw their trades overboard; and before the smoke clears away December wheat will break four or five points."

Cappy Ricks put his old arm round his young friend and gave him a paternal hug. He winked wickedly.

"My dear boy," he suggested, "suppose you and I go out and pin one on? Hey? How about you, boy? A pint of '98, in order that we may properly drink confusion to the wolf of want and damnation to dull care!"

IV

LATE that afternoon Cappy Ricks graciously summoned the Chronicle reporter to his office and told him in detail all he knew about the Australian wheat invasion.

"Of course," he added, "this may be mere street gossip; but I think there's something in it, my boy. At any rate, I thought you might care to be tipped off to the situation. It looks like a corking story to me. I suggest that you call on Ford & Carter and see what they have to say about it."

"I wonder whether the Examiner reporter has a tip on this?" the Chronicle man queried hopefully.

"Not from me. This story is for you, young man. That's why I called you down to my office."

About the same hour J. Augustus Redell might have been seen at the press table on 'Change, unfolding a similar story to the market reporter of the Examiner, who thought it was a humdinger of a story, and so declared.

"All right. Glad you think so," Mr. Redell replied, beaming upon him. "And, just to show you I'm right, I'll not breathe a word of it to the Chronicle man."

Having planted his journalistic bomb, Mr. Redell glanced at his watch. It was exactly eleven o'clock. "I still have time," he murmured, and departed immediately to the office of Gregg & Co., where he placed an order to sell for his account up to half a million bushels of December wheat, but to cease selling the instant the market hesitated to absorb it or the price broke a point. At the same moment, in another brokerage office, Cappy Ricks was issuing a similar order. Before the market closed, Cappy had succeeded in selling a hundred and eighty thousand bushels, while Redell had disposed of a hundred and thirty. Evidently the bears took it as it came, for the market closed strong at $1.89.

JORDAN

The Unusual

Distinctive and Irresistible

Ever stop to analyze the reason why people gather around some cars and pay no attention whatsoever to others?

Why don't they stare at all cars? What is it that prompts people to crowd around certain cars—to linger, stare and admire?

Its style. That's all. Clean-cut, genuine, good-looking style. Its smartness—attractiveness. That's the Jordan!

The Jordan custom style bodies are the most distinctively individual bodies in America.

The long, low, rakish, smart lines, plus the attractive mahogany maroon and Venetian green color schemes are a refreshing change.

When you drive in your Jordan you know that every pair of eyes within focus is taking a good long look at your car.

But that is not all.

Beneath the handsome Jordan body are the world's foremost motor car units.

The Jordan contains more of the complete standard specifications of the Society of Automobile Engineers than any other car made in the world today.

There's the famous Continental motor. This big, sturdy, smooth-running, quiet-as-a-mouse six-cylinder brute slides along with the ease of an eagle. It's "there" in every sense of the word.

Then there's the Bosch ignition system—Bijur two-unit starting and lighting system—Stromberg carburetor—Vanadium steel springs—Timken axles and bearings—Fedders radiator—Boyce Motometer—Brown-Lipe transmission—Willard batteries—Stewart-Warner vacuum system.

All top notch first water units.

So with a chassis as sound as gold specie you can now get a distinctive and attractive style body at a very attractive price.

Whether you own one or not, the Jordan is the car you'll always admire.

The most distinctive car on the road.

THE HILL-SMITH METAL GOODS COMPANY

82 Brookline Avenue, BOSTON, MASS., U. S. A.

(Concluded from Page 70)

Neither Cappy nor Redell reported at his office the following day. At the hour when the market opened in Chicago both schemers appeared on the floor of the Merchants' Exchange and bent their anxious gaze upon the only blackboard on 'Change they had not heretofore honored with their scrutiny—the board in back of the Grain Pit, which carried the quotations on the Chicago Board of Trade, already beginning to come in by wire.

For an hour the trading was inactive. Then suddenly the price broke half a point as somebody tossed a lot of fifty thousand bushels on the market. Cappy and Redell each wondered whether he might not be the responsible party; and while they pondered somebody unloaded a hundred thousand bushels at $1.88. Cappy gasped as the quotations appeared on the blackboard.

"Something doing, Gus!" he whispered; Redell nodded.

And now commenced a period of wild trading. The price crept back to $1.89, only to be assaulted and beaten back to $1.87; then, fraction by fraction and point by point, the price fell; and J. Augustus Redell wagged his head approvingly.

"They have received our message," he said. "The riot is on!"

When the price had been beaten down to $1.83 Cappy turned to his associate.

"I'm through!" he said. "Time to cover my shorts." And he trotted away to a telephone booth.

As for Redell, he would not intrust his fortune to a telephonic order, but sprang into his runabout, parked at the curb outside the Exchange, and scorched uptown to Gregg & Co.'s offices, where he learned that he had sold four hundred and ten thousand bushels of December wheat. One hundred thousand had been sold at $1.90, two hundred and eighty thousand at prices varying from $1.89 to $1.88⅛, and the remainder at $1.88.

"Buy me four hundred and ten thousand bushels at the market," he ordered.

Before he left the office the sale had been confirmed and Mr. Redell's shorts had been covered at a price ranging from $1.83 to $1.83⅝, whereupon he closed out his trade and received a check for his margin and his profits. An hour later he met Cappy Ricks again on 'Change.

"Well, Cappy?" he queried.

"I cleaned up, thank you," the old gentleman informed him. "Sold, bought, and got the money. This is one time it rained duck soup and I was there with a bucket."

He prodded Mr. Redell playfully in the short ribs and the incident was closed. They had made a profit of more than twenty thousand dollars each; and when each returned to his office he forgot all about December wheat until half past five that evening, when both met on the deserted floor of the Exchange to scan the blackboard. December wheat had closed that day at $1.83!

Two days later J. Augustus Redell called Cappy Ricks on the telephone.

"That you, Cappy?"

"Yep!"

"Redell speaking. Read the story on the front page of the Chronicle this morning?"

"No; what was it?"

"The British Government has placed an embargo on the exportation of wheat from Australia; so all those eighteen charters I negotiated with Ford & Carter are knocked out."

"You don't say so!"

"Surest thing you know, Cappy."

"Well, say! That makes it hard on Ford & Carter, doesn't it? All those ships on their hands and no wheat! They'll have to hustle like the devil to dig up new business for them."

"Not at all! There's a clause in the charter parties that saves them. You know, Cappy—that line about fires, floods, strikes, lockouts, the acts of the public enemy, and other causes beyond their control. Consequently the ships are back on their owners' hands. I wish you joy of your five, Cappy."

"Well, that's all right. Considering my winnings in December wheat I won't hold it against Ford & Carter; so you needn't inject that note of malice into your conversation. Those boys are stuck hard enough as it is, I dare say. They've contracted to deliver a lot of Australian wheat to various milling companies; they can't do it, and I'll bet they'll be sued out of house and home for breach of contract."

"Oh, no, they won't! They hedged on their quotations when making them; all those telegraphic orders were placed with Ford & Carter subject to Ford & Carter's ability to make delivery and to prior sale. Before Ford & Carter could make them firm orders and get in over their heads, I tipped them off to the possibility of this government embargo."

"You tipped them off! How did you know the British Government was going to clap an embargo on Australian wheat?"

"Why, I didn't know," Redell confessed. "I just guessed it would; so I advised Ford & Carter to lay low a day or two and await developments. Said developments appear to have arrived according to schedule, so everybody's happy. I have even reimbursed Ford & Carter to the extent of a two-hundred-and-eighty-five-dollar telegraph bill they incurred. You see, Cappy, I gave them the wrong steer, and I knew it was wrong when I gave it to them; consequently my conscience wouldn't let me rest until I'd squared myself."

"You in-fer-nal scoundrel! Well, you didn't give me the wrong steer; and I'm surprised at that. For once in your life you're on the level."

"Don't cheer until you're out of the woods. Do you remember that German steamer, the Valkyrie, that you skinned me out of last year?"

"Yes."

"And do you remember how you used to send me statements of her earnings and write me ironical letters about the Irish dividends I was getting from her?"

"Yes-s-s, I remember."

"And do you remember how, when I tried to get even on you by inducing you to short the lath market, in order that I might sting you for about ten thousand dollars while I made twenty, you outgeneraled me and made a star-spangled monkey of me?"

"Ah!" Cappy chuckled; "you bet I remember that! Maybe after a while, my dear young friend, you'll get enough of this funny business and lay off on the old man."

"I'm off you now. I've had enough of you, Cappy Ricks. I've made fifty thousand dollars off you in the past week; and that satisfies me."

"Gus, don't lie to me! You didn't make a cent more than I did—and I made a trifle more than twenty-four thousand dollars."

"Is that so? Well, listen to me tell it: When you and I cashed in that day our deal was closed, wasn't it?"

"Yes."

"And I'd played fair with you?"

"You certainly did, Gus."

"Then I was freed from any further obligations to take you into partnership with me, was I not?"

"That's how I figure it, my boy."

"That's how I figured it also, Cappy. Consequently, being morally certain that the British Government would place an embargo on the exportation of Australian wheat—Cappy, you must admit that the British Government would have been absolutely crazy if it didn't—I just called on Gregg & Co. and bought another half million bushels of December wheat at $1.83 to $1.84 a bushel. Then I sat tight and waited for that embargo story to break. Cappy, do you know that story just raised hell on the Chicago Pit to-day? The bears were caught napping; and the bulls got busy and kicked the price up to $1.90 again, at which figure I unloaded and took my profit."

"You amazing rascal! Why didn't you tip your partner off to that deal?"

"We were no longer partners. You admitted that a moment ago. When I first outlined this scheme I didn't have a dollar to spare with which I could speculate. Every last buffalo nickel was tied up in the business of the West Coast Trading Company. So I schemed to take you in as a partner on one-half of the deal; and you not only financed me but guaranteed me to the broker! Your introduction was all I wanted. After that my credit was as good as December wheat; in consequence of which, without a cent invested, I was actually enabled to carry a trade for half a million bushels! Much obliged to you, Cappy. You're a fine old sport, and I like you—particularly now that I've collected those long-deferred Irish dividends! I wouldn't be surprised if you laid off on me after this—eh, Cappy?"

"Gus," said Cappy Ricks, "one of these days the Democratic party is going to wake up and discover that America isn't where they left it the night before! And when that happens they're going to ask you about it, you—you—infer-nal ——"

The phone clicked. J. Augustus Redell had hung up.

"Drat it! —— God bless him!" murmured Cappy Ricks—and hung up too.

Yes, a Monopoly
IN HUDSON SUPER-SIX
But Note How We Employ It

It is true, as some say, that the Super-Six motor constitutes a Hudson monopoly. We control it by basic patents. One must buy a Hudson to get it. But note how far the Super-Six under-sells many cars which it out-performs.

We must expect that every possible argument will be used against the Super-Six.

The arguments used a year ago have all been disproved and abandoned. Over 28,000 Super-Six owners have proved every suspicion baseless.

Now some say, "We also have an improved Six." Some argue Eights and Twelves. And some reflect on the Super-Six monopoly.

Mark the Hudson Value

But remember that Hudson has won by performance the pinnacle place in Motordom.

The Super-Six motor has added 80 per cent to the car's efficiency.

It has proved an endurance which is yet beyond measure—probably a doubled endurance.

Against all other types, however costly, it has won all the worth-while stock-car records.

And a year has been spent to make this car, in every detail, worthy of its front-rank place.

Yet note now many rivals—all without the Super-Six motor—sell above the Hudson price. Every buyer of the Hudson Super-Six gets a value of performance which can't be matched.

Why Another Type?

Then why consider another type of motor in buying a high-grade car?

Not because of performance. The records of the Super-Six prove it supreme in that.

Not because of endurance. The Super-Six excelled—as high as 52 per cent—in the feats which prove that.

Not because of smoothness. The whole Super-Six supremacy comes through minimized vibration.

Not because of anything. If any other motor type were better, don't you know that Hudson would adopt it? Rival types are not controlled by patents.

The Friction Question

The only question is, What motor best reduces friction? For that is the aim of all.

It is motor friction that wastes power, that limits performance and that causes wear.

Friction was the limitation of the old-type Six. Friction caused the trend toward Eights and Twelves. And the solution of this problem is what stopped that trend. The Super-Six invention, by reducing friction almost to nil, gave the crown to a new-type Six.

It isn't speed, or power, or hill-climbing ability which makes the Super-Six supreme. It is endurance, due to lack of friction. That is what won those records. If that is important the Super-Six is important.

A New Gasoline Saver

The latest Hudsons have a new gasoline saver which adds greatly to their economy. They have bodies which show our final attainment in beauty, finish and luxury.

To own a Hudson Super-Six means to rule the road. And this car, in any crowd, looks the monarch that it is.

Phaeton, 7-passenger	$1650	Touring Sedan	$2175	Town Car	$2925

YOU and *Everyone* Would Eat Peanut Butter if it were *ALL* made like Beech-Nut

WE firmly believe that if all peanut butter were made in the Beech-Nut way, far more people would be users of peanut butter today. Because more people would realize what a finely flavored food peanut butter is; how nourishing; how handy.

"What are the reasons why the flavor of the Beech-Nut Brand is different from that of any other?"

Reason No. 1: Only No. 1 quality (choicest grown) peanuts used. This quality commands the highest price. Peanuts that cost one-third less would make a fair peanut butter. But they could not make *Beech-Nut* Peanut Butter.

Reason No. 2: The flavor is *blended.* Rich Spanish peanuts and flavorous Virginia peanuts are combined in just the right proportion to give perfect peanut taste plus richness of flavor.

Reason No. 3: Uniform roasting. Correct roasting is determined solely by *color.* We roast our peanuts under great North skylights, so that the roasting expert has an unvarying light by which to see just when the nuts have reached the right light brown color.

Reason No. 4: Beech-Nut Peanut Butter is absolutely *free from grit.* We have devised ingenious processes that remove all skins, defective kernels, the little bitter "hearts" and grit.

Reason No. 5: Uniform crushing and seasoning. Remarkable machines crush the nuts and salt them evenly at the same time.

Reason No. 6: Careful packing. The finished butter pours directly into the jars, filling from the bottom first, to exclude air. Careful vacuum-sealing completes the process. This is why Beech-Nut Peanut Butter always comes to you pure and sweet—*never rancid.*

Thus you see that the making of fine peanut butter is not a simple process, and that to obtain delicious flavor and goodness, *infinite* pains must be taken.

Mothers: Children love Beech-Nut Peanut Butter dearly. Give them all they want, for a sandwich of Beech-Nut Peanut Butter contains all the Strength, Heat and Energy that a glass of rich milk does.

Don't forget that grown-ups like it too. Have Beech-Nut Peanut Butter on the table at every meal. Spread it on crackers, bread, toast—it is fine on saltines. Order a jar today.

BEECH-NUT PACKING COMPANY, CANAJOHARIE, N. Y.

FELIX

(Continued from Page 11)

"No one has accused you of stealing a dog, Monsieur De Brancheville."

"Then what in heaven's name am I here for?" he demanded.

"Monsieur De Brancheville," said Le Febre, "let us make this interview as little unpleasant as need be. I assure you that this kind of thing is wholly useless. You are a gentleman. I should prefer to talk to you as one."

"As a gentleman," said De Brancheville testily, "I assure you that if my arrest is not over the matter of a dog I have no idea what it is for. If you will be good enough to tell me, in spite of your conviction that I already know, we shall get on faster."

"But for what purpose?"

"Merely to oblige me, if no other reason occurs to you."

"Very well," said Le Febre indulgently, "we will play the comedy out. I have, therefore, to inform you, Monsieur De Brancheville, that a certain quantity of radium, duly tested and certified, was delivered on Monday to Professor Rochefort, director of the government laboratory, by one George De Brancheville, and payment made therefor by the French Government to the amount of one and a half million francs."

He paused and De Brancheville looked at him in perplexity.

"Owing to the circumstance that the laboratory staff was engaged upon work of an urgent nature," he continued, "this radium was at once placed in the vault. The combination of this vault is known only to Professor Rochefort and to his assistant, Monsieur Claude Dubois. So far as is known, the vault was not opened again until this morning, when the leaden containers were removed, examined and found to contain particles of zinc instead of radium. Now Professor Rochefort is positive that he received the radium from Monsieur De Brancheville. He is equally positive that neither he nor Monsieur Dubois effected the substitution. Monsieur Dubois, it appears, was so much affected by the responsibility of knowing the combination of the safe that both evenings, upon leaving the laboratory, he insisted upon being searched.

"Under these circumstances you will see that it was necessary for the police to consider all possibilities. One of these possibilities was that, by some means known only to himself, the person ostensibly delivering the radium to Professor Rochefort, in fact delivered containers filled with crumbs of base metal. It is my desire to find out how this substitution was effected, and that I may state is the reason for this interview."

"But this is outrageous!" cried De Brancheville. "Without a scrap of proof, you charge me with a crime and bring me here to be insulted!"

Le Febre gazed at him over his spectacles and drummed thoughtfully on the desk with an ivory paper knife.

"Is it possible, Monsieur De Brancheville, that you do not yet know that the radium has been discovered in your apartment at your hotel?"

De Brancheville sat speechless, staring at the speaker.

"Discovered in my apartments?" he said at last. "Is this some practical joke or am I crazy?"

Le Febre shrugged his shoulders. From a drawer he took four small leaden boxes, each about an inch long by three quarters wide, and laid them on the desk.

"There is, of course, the possibility," he said, weighing his words with a shade of irony, "that this is not the stolen radium. Would you care to examine it?"

De Brancheville opened one of the boxes and dumped a flake of metallic substance on the table. He looked at Le Febre in stupefaction. He examined the contents of the other three containers.

"This is the radium I sold the laboratory," he said. "There are no pieces of equal size in Europe. The containers are too light for such large quantities," he added irrelevantly.

"Then you identify the radium, but not the containers?"

De Brancheville nodded.

Le Febre remained in thought for some moments, then took from the drawer a crumpled sheet of white tissue paper and ten inches of narrow blue ribbon.

De Brancheville started. The paper and ribbon were similar to the paper and ribbon that had wrapped the dog collar. He saw, with the eye of his mind, the four leaden boxes, piled two on two, making the cubical package which the clerk had described. If it had not come with the collar, where had it come from? If Primavera had sent it, how had she obtained it? What was her motive in sending it? What did it all mean?

"I see the wrappings of this little package interest you," observed Le Febre.

De Brancheville made no reply.

"You have nothing to volunteer?"

De Brancheville shook his head.

"Well," continued the police official patiently, "let us suppose that this package was conveyed to your apartment, while you were absent, and recovered by our agents before your return. Suppose also that you had never laid eyes on the package, thus wrapped and tied. What, therefore, is the association of the ribbon and tissue paper which so obviously interest you?"

"I must decline to answer that," said De Brancheville.

"It is natural," said Le Febre, "and yet I advise you to answer."

"You have my answer," said De Brancheville.

"Monsieur De Brancheville," said Le Febre, "the evidence against you is complete. Most police officials would consider the case closed. Curiosity, however, is a weakness of mine. I am more interested in the details of a crime than in making a record for convictions. Now I know that this package was sent to you by a woman, for the reason that the bow in which the ribbon was tied could only have been tied by a woman. It is creditable to you that you should refuse to disclose her name, but your refusal can, at most, but delay the discovery of her identity. Why not be frank with me? If she has acted innocently, as I think is not improbable, you have my word that she will not be drawn into the case."

De Brancheville was silent, turning the matter over in his mind. Finally he said:

"Monsieur Le Febre, because I am convinced that whatever part the woman in question may have played in this strange transaction is unquestionably an innocent one, and because apparently the one chance of getting at the truth of the matter depends upon your assistance, I will tell you all I know of the affair, though that is indeed little."

"Who then is the lady?" asked Le Febre.

"Her name I cannot tell you," said De Brancheville.

"But that is the point of my question."

"For the reason," De Brancheville continued "that I do not know it."

Le Febre shot a surprised look at him.

"Proceed, Monsieur De Brancheville," he said in even tones.

"About eleven o'clock this morning," began De Brancheville, "I was walking through one of the short streets that runs into the Rue Faubourg St. Honoré, not far from the Avenue Hoche, when my attention was attracted by an automobile running over a dog. The car stopped and a woman, perhaps thirty-five but younger in appearance, sprang out. I ran to her assistance and immediately perceived that she took me to be the owner of the dog. It is enough to say that I did not undeceive her."

Le Febre smiled.

"It is conceivable," he said, "that a man should practice such a deception."

"This lady," continued De Brancheville, "was on the way to the banking house of Carruthers & Grimshaw, and it was suggested that, before taking me to my hotel, she keep her appointment. I thereupon got into her car with the dog."

"I see," said Le Febre.

De Brancheville then went on with his narrative, describing his interview with Carruthers, the invitation to visit the dog, the departure of the automobile without an address being given, his efforts to find Carruthers, the discovery of the advertisement, the arrival of the collar wrapped in white tissue and tied with ribbon, and finally the return of the substituted Airedale.

"I was on the point of telephoning for Carruthers' address in London," he concluded, "when I was arrested and brought here."

Le Febre remained in thought, tapping softly, with the paper cutter, upon the desk.

"Well Monsieur De Brancheville," he said at last, "your story compares in probability with the history of the fisherman

Willys Knight

Concerning—

Carbon

To you—to every experienced motorist, carbon means lessening power, increasing fuel consumption, engine "knock," valve grinding, cylinder cleaning and recurring loss of the use of your car.

It is the conspicuous enemy to the joy of motoring.

Carbon accumulates in the cylinders of the Willys-Knight Motor as it does in other types of motors—but in lesser degree—and with exactly *opposite* results.

The sleeve-valve construction of the Willys-Knight motor enables it to make *beneficial use of carbon.*

As carbon accumulates on the metal surface of these sleeves, it is evenly distributed by their sliding action, and becomes a polished smooth-as-glass coating,—smoother than it is mechanically possible to polish any metal.

Instead of unseating the valves, carbon seals the fit of the sleeve-valves of the Willys-Knight Motor.

And the result is *a gain in compression and power* for the Willys-Knight Motor instead of a loss—*increasing quietness, smoothness, flexibility and fuel economy* instead of a decrease.

Carbon is in this manner the reconstructing life which builds up and sustains the efficiency of the Willys-Knight Motor.

So instead of deteriorating, the Willys-Knight Motor *improves with use* and instead of succumbing to carbon troubles it *thrives on carbon benefits.*

This is one of the many reasons why the Knight motor has been standardized for the steady hard usage of the London Omnibuses and the Fifth Avenue Buses in New York.

This is one of the many reasons why the Knight motor is used by the leading manufacturers of Europe.—Daimler of England, Panhard of France, Minerva of Belgium, Mercedes of Germany and nineteen other European producers.

This one of the many reasons why twelve thousand discriminating American buyers purchased Willys-Knight Motor Cars during 1916 and drive them with steadily increasing respect.

"Here Go My Corns"

"I'M just one of the millions who have used that easy, remarkably simple, and painless remover of corns and calluses, 'Gets-It.' I don't have to 'putter' with my corns any more and make them sore. I just put 2 or 3 drops of 'Gets-It' on. It takes only a few seconds, and it dries immediately."

"GETS-IT"

Common-Sense Corn-Remover

It's a pleasure to use "Gets-It"—there's no work, discomfort or pain in its use. Just notice how that corn or callus loosens right off from your toe, so you can just peel it off with your fingers! "Gets-It" "gets" the corn only, not the surrounding flesh. It will make it unnecessary to cut, or dig at, a corn to remove any part of it. Try "Gets-It" tonight, surprise yourself and lose a corn.

and the ring in the Arabian Nights. But perhaps the most extraordinary thing relating to it is the fact that I am inclined to believe it."

De Brancheville rose impulsively, but Le Febre restrained him with a gesture.

"Slowly," he said; "my belief is my personal conviction; that is all. The evidence against you, as I have said, is complete. Men are guillotined every week on less. As the case stands, you face twenty years in the galleys. I have no right to release you. But I am warranted in experimenting to this extent. I will give you twenty-four hours to discover the identity of the lady and report to me where she obtained these four containers. It would not be difficult," he added, "to make the investigation myself, but I have my own reasons for doing otherwise. Even a police official has his whims."

Their eyes met and De Brancheville thought the shadow of a smile lurked in the police official's.

"However," he added, "you understand that you will be under surveillance and that it will be impossible for you to leave Paris." He touched a bell and an attendant appeared. "Show Monsieur De Brancheville to the street," he said.

Two minutes later De Brancheville hailed a taxi and drove to his hotel. Entering his rooms he took off his hat, mopped his forehead and rang for a brandy and soda. Presently he felt better and telephoned Carruthers' house. He learned that Carruthers had left no London address, but was to wire after he arrived. Thereupon De Brancheville went to bed.

III

AT TEN o'clock the next morning no word had come from Carruthers. De Brancheville then drove to the bank and asked for Grimshaw, the junior partner. It would entail an embarrassing explanation, as he did not know Grimshaw, but there was no time to be squeamish. Grimshaw, however, was enguged in an important conference and could not tell when he would be at liberty.

De Brancheville started back to the hotel on foot. The cards were running against him, and there was nothing to do but wait. Suddenly he remembered his promise to visit Raoul's fiancée at eleven. He took the note of introduction from his pocket. It was addressed to Mademoiselle Ann Pendleton. The envelope was unsealed and he read the contents. It said:

Dear Ann: This is Raoul's cousin, George De Brancheville, who wants to talk to you. He is very amiable. Be good to him! I am explaining to your mother about his coming.

De Brancheville called a taxi, gave the street number to the driver and got in. The taxi stopped before an unusual looking house, the frontage of which was extended by a high wall, indicating a courtyard. As he rang the bell he saw a man on a bicycle slow down, half a block beyond, and turn back. He had noticed the same man passing Carruthers' bank.

Obviously Le Febre was keeping track of his movements.

A footman opened the door, ushered him into a small reception room and took the letter of introduction. In a few moments he reappeared, led him through a passage opening upon the court, across this and through a wicket gate, into a garden. His first glimpse took his breath away. There was a mimic winding lake, along the grassy margin of which clumps of tulips and narcissi bloomed. On a miniature island a great willow trailed its festoons of new green. In one corner the ground rose and became a little hill, surmounted by a temple masked in cedars; in the other an ancient apple tree, a mass of bloom, towered above the shrubbery. The air was sweet; the sound of bees mingled with the play of an unseen fountain. He seemed to have stepped into an enchanted paradise. He thought of Le Febre's allusion to the Arabian Nights.

His guide led him down a winding path in the direction of the apple tree. A dozen paces and they entered a little formal garden fenced with high cedars. At the farther gateway the footman stood aside. De Brancheville had a view of green grass, a glimpse of water where the lake ended, and then, on a marble bench, the drifting apple bloom about her, an Airedale at her feet, sat Primavera. His heart stopped beating. This was Raoul's fiancée. This was the end of it all.

The cake of Pears Soap you'll buy next February is aging now for you.

Hurry and rush never spell perfection. Pears' could not be the Perfect Toilet Soap were it made and handled like ordinary soaps.

First, it is made of the purest materials skillfully blended, with the century-old experience of the largest manufacturers of high-grade toilet soap in the world—

Then every cake is laid away in racks to age a full year before it is offered for sale.

You would call it good soap if you bought it within a few weeks (as you do other soap), but the makers of Pears' know that 12 months' curing will make it better. Every drop of moisture is lost and Pears' comes to you not only as the perfect toilet soap but the most economical soap.

Do you appreciate such care? Your complexion will, if you do not. The tenderest skin welcomes the soft, cleansing effect of a daily bath with Pears'.

Your dealer has Pears' of course.

Pears' (unscented) is 15c a cake; box of one dozen, $1.50. Its only odor is the refreshing fragrance of the choice oils from which it is made.

Pears' Glycerine Soap (scented) is 20c; box of three cakes, 51 cents.

If you wish to test Pears' for little expense, Walter Janvier, 419 Canal Street, New York, (Pears' United States Agent) will send you a trial cake of the unscented for 4c in stamps.

What's leaking?

There is a big *invisible* leak going on all the time in your engine. If you could *see* one-fourth of your gasoline, oil and power going to waste through the ordinary piston rings in your motor, you would get gas-tight piston rings at *once*.

Inlands will stop the waste

of fuel and make your motor *much* more powerful and more responsive. The Inland reduces the cost of equipping your car with gas-tight piston rings because it is

A gas-tight ring in one piece

at a *one-piece price*. Absolutely gas-tight—because it has no gap, and its spiral cut (patented) causes it to uncoil and expand in a *perfect circle*, making positive contact with the entire inner circumference of the cylinder.

INLAND
1 PIECE PISTON RING

Inlands cost less—ask your garage.

Inlands for your motor will cost only a few dollars; and give you an astounding increase in power and mileage per gallon of fuel.

They *last!* They *stay* gas-tight because they have no weak or thin places to wear or break—same width and thickness all around.

90 days' trial—money back guarantee. Already used on 100,000 cars. Standard equipment on Franklin, Pathfinder, Kissel Kar, Apperson and Weidely motors.

Her eyes danced as she saw him. She rose and held out her hand.

He bowed and took it.

"Is anything the matter?" she demanded. "You look as if someone were dead."

"It's a bit of a surprise," he said.

She burst into a peal of laughter.

"Do you mean you didn't know?" she cried. "You didn't find out from Carruthers?"

He shook his head.

She laughed again.

"Then I can understand. When I read your name on your walking stick I was dumfounded myself. You see Raoul and your aunt had talked about you, and I knew they hadn't an idea you were in Paris. I wanted to surprise them, get them here to meet you or something; but when you went into the bank for me I thought, of course, you'd find out. I want to thank you again for what you did," she added; "I didn't realize at the time all it meant!"

"Please ——" he protested. He stood gazing at her dumbly.

"You are a strange man!" she exclaimed. "Aren't you glad to see me again, to see Felix? Aren't you excited over it all? To think it was your dog I ran over!"

"To tell the truth," he answered, "my capacity for excitements is giving out. Just at present I'm out on bail, preliminary to spending twenty years in jail."

"Jail?" she replied. She looked at him skeptically.

"It's the truth," he laughed mirthlessly. "What is going to happen to me depends a good deal on you."

"On me?"

He nodded.

"What I want to know is where you got the four leaden boxes that you sent me with the dog collar."

"Why, those," she said, "were in Felix's collar. You know the four little pockets in the heavy leather. Julie, my maid, took them out herself and wrapped them up separately."

De Brancheville exclaimed softly.

"Was anything in them that has been lost?" she asked.

"Those little boxes," he said, "happened to contain the radium which I sold the French Government two days ago, and which was subsequently stolen. As the police found them in my rooms the consequences have been embarrassing."

She looked at him blankly.

"But how did they get in the collar of your dog?" she demanded.

"It isn't my dog," he answered dryly.

"Not your dog!" she gasped. "But why did you say it was?" Suddenly she stopped and dropped her eyes. He saw the color deepen in her temples.

"My dear Miss Pendleton," he said, "we must remember that I am here on an embassy. Raoul's mother must have written your mother."

She began to laugh.

"Ann hasn't come in yet," she answered, "I am Miss Pendleton's mother."

It was De Brancheville's turn to gasp. But even gasping was beyond him. He gazed at her speechless. Hundreds of years seemed to fall from his shoulders. As his emotions registered—as they say in films—she blushed furiously and bent down over the dog.

"Well," he said at last, "I can only say ——"

His sentence was never finished, for a man servant appeared with a silver tray, on which lay a letter.

"For Monsieur De Brancheville," said the man.

De Brancheville took the letter wonderingly and the man departed.

"Who can be writing me here?" he said. "No one knows I am here."

She made no answer, but glanced up at him from her defenses.

He tore open the envelope and looked at the signature.

"Ah! it is from Le Febre, my jailer. May I read it?"

"Of course."

"'I am sending you the final chapter,'" he read aloud. "'It appears that the person who advertised the lost dog, upon recovering his property at the newspaper office, insisted that certain objects had been removed from the collar. I daresay by this time you have ascertained who it was that removed them. As it was known that Monsieur Dubois had been accompanied to the laboratory, on the days in question, by an Airedale terrier, it was not difficult to obtain his admission that he had employed the dog to convey the radium out of the building.'"

"Then it's all right," she exclaimed. "You knew, of course, it would be. But tell me what happened! How did you send his dog back when Felix was here?"

He told her.

"Really," she said, "for a grown man to ——"

"There's more to the letter," he suggested. "Do you want to hear it?"

She nodded.

He read on:

"'Permit an unromantic police official to express his congratulations and the wish that the considerations which prompted Monsieur De Brancheville to steal will be found to justify his crime. Unofficially I advise you to present the stolen dog to madame.'"

As he finished, she was bending even closer to Felix. For a time neither spoke. De Brancheville broke the silence.

"I have revised my ideas about the mirage," he said. "It does come true. The only question is ——"

She lifted her head and met his eyes unflinchingly.

"Think," she said; "I have a daughter seventeen."

"What has that to do with it?" he demanded.

She looked away in silence for a time. Then she faced him and seemed about to speak, when voices were heard beyond the cedars.

"It is your aunt," she said, "and your grandfather."

She rose hastily and glided through the gateway to meet them.

"We came," De Brancheville heard his aunt say, "to tell you that the young people have composed their differences. I don't suppose George De Brancheville has put in an appearance?"

"Monsieur De Brancheville is already here," Vera answered.

"I see him," cried the old man; "he is there underneath the apple tree. Come forth, villain!" he called.

De Brancheville went through the little gateway and stood beside Vera.

Madame De Courville-Rochers raised her lorgnette and glanced sharply from one to the other.

"Papa," she said, "I should judge that we were interrupting. I thought you two were strangers?"

"Hardly that," said Vera; "we met yesterday morning."

"He never mentioned it yesterday afternoon. Did Raoul bring him here?"

"Not Raoul—it was through Felix ——"

"Felix?" she repeated questioningly, at the same time searching her memory for the bearer of the name.

There was no answer to her question, for the duke, a spry excitable little old man, suddenly shouted:

"They are blushing! Even George is blushing! *Ma foi*, but they are making game of us!"

"Behave yourself, grandpapa!" said De Brancheville.

"Embrace me," cried the old man. He clasped his grandson, kissed him on both cheeks and whispered, "But how did you know I had selected her?" Receiving no answer he turned to Vera. "My dear," he said, "with much greater pleasure I embrace you. If I were young again there would be no George! As it is ——" He shrugged his shoulders. He was turning away when he stopped. "You are all dining with me to-night. Remember there shall be veal for the prodigal and roses for the fair."

"You ridiculous grandfather!" said De Brancheville.

"Not a word from you, sir!" answered grandpapa. "And now, Suzette, I must take you away." Seizing Madame De Courville-Rochers by the hand, he proceeded to do so.

"Well," said De Brancheville when they were alone, "they seem to have arranged it."

"There is Felix trying to walk on three legs!" she answered and, smiling back at him, ran through the opening in the cedars toward the apple tree.

FOR TWENTY YEARS OLDSMOBILE HAS EPITOMIZED AMERICAN IDEALS

A primary force in our national leadership today is the American sense of values. Here in this "melting pot" of civilization is born the balanced judgment.

Consciously or unconsciously our men and women who come to the car-buying plane measure truly. They weigh values with rare accuracy.

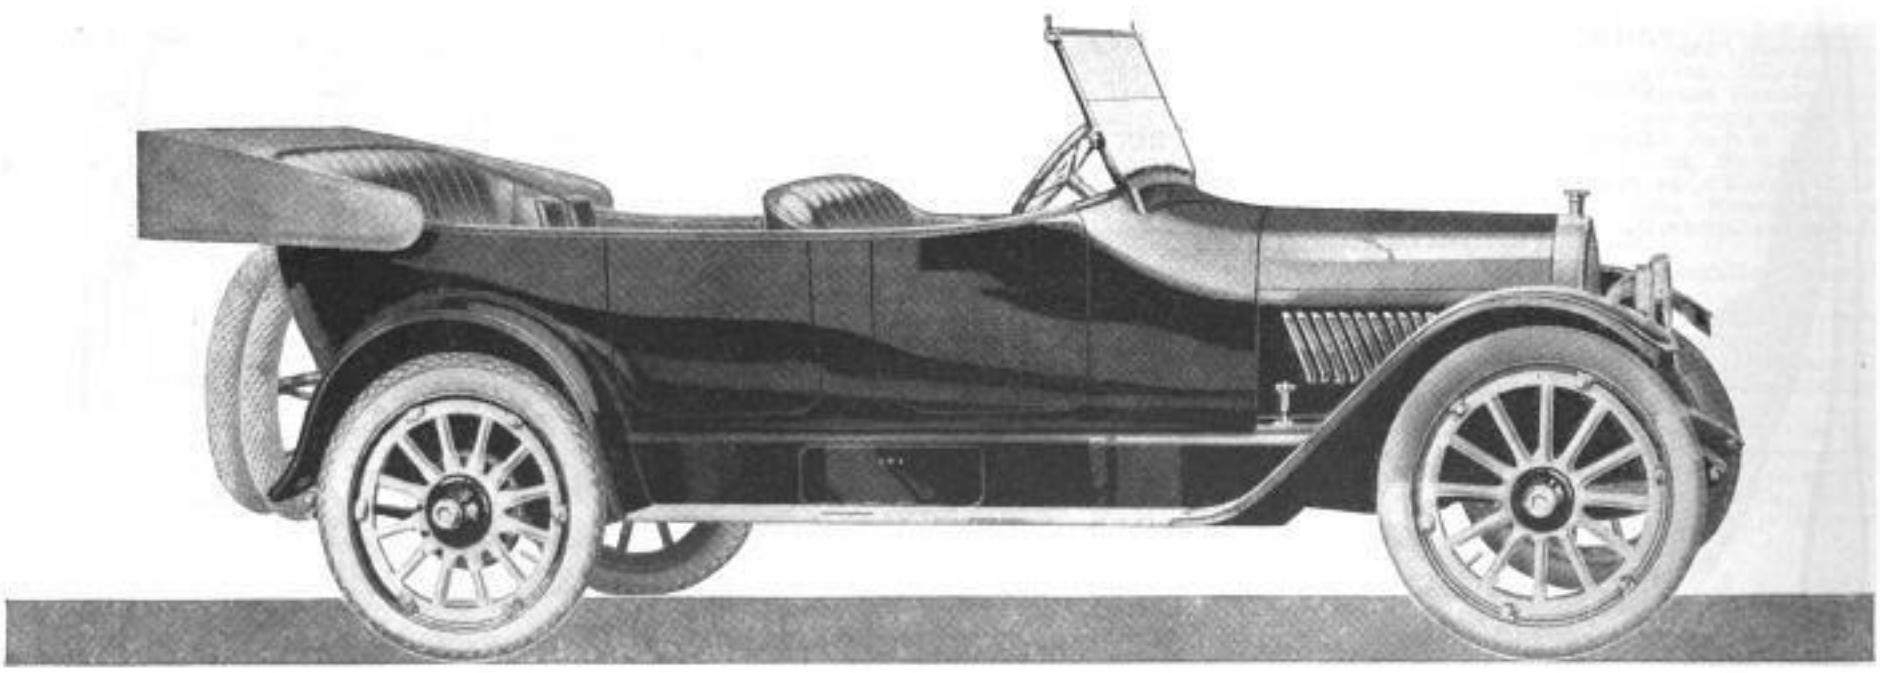
So it is that the Oldsmobile has come to be counted as that car which is truly American, reflecting all that is finest in our industrial and social progress.

A car for those who are uncompromising in demand for quality and efficiency, and by the same token have no patience with artificial values.

That genius which created the Oldsmobile at the dawn of motor vehicles has, for twenty years, kept it in the vanguard of pleasure car achievement.

Created for the discriminating, the cost of material has never counted. One seeks in vain for a car of truer design, finer metal, better cushioning, better leather, stronger wheels, and so on through all parts.

Art is there, too, in its subtle grace and refinement, its quiet beauty, its inbuilt dignity.



And as the car epitomizes American ideals as a finished machine, so does the Olds Motor Works epitomize American ideals in manufacturing efficiency. That is why the Oldsmobile is counted the car of American Ideals—more so than ever for 1917.

If you contemplate the purchase of an automobile at any price, see the Oldsmobile dealer. He will demonstrate, as you request, Sixes, Eights, Runabout, Roadster, Cabriolet, five or seven passenger Touring Car or Enclosed Type.

The Prices Range from $1095 to $1850

OLDS MOTOR WORKS, LANSING, MICHIGAN

BORROWING FROM YOUR UNCLE

(Continued from Page 19)

the day on which he appeared before the Federal Farm Loan Board, at Topeka, he was elected president of the American Bankers' Association, a position which he now holds. If he stood alone in his opinion of the facility which long-time, amortized first mortgages will offer to men who cannot pay half the value of the farms they desire to buy, the mere fact that he is a prominent banker would not prove the case; but he agrees with most bankers who have studied the matter.

Mr. Gordon Jones, of Denver, an authority on both rural credits and banking, states in a little booklet issued by him that, in his opinion, perhaps the most noteworthy effect of the Federal Farm Loan Act will be to enable tenants to buy farms under the method outlined. Bankers from Central Kansas testified that fifty per cent of the tenants in their neighborhood will buy farms on this plan with the proceeds of their dollar-and-seventy-five-cent wheat this year.

The same state of things was testified to in the South as a result of eighteen-cent cotton. Corn Belt tenants do business on rather a large scale and, as a rule, possess resources sufficient to enable them to use this plan in purchasing farms if they remove to regions where the price of land is a little lower—if they can have some security against the overvaluation of the land in the new country. The valuations of the Federal Land Banks will give them a safer estimate of land values everywhere than they now possess; and will save them from some, at least, of the traps and pitfalls set for them by real-estate enthusiasts—not to use stronger words.

In Baltimore there came to our hearing a gentleman who seemed greatly interested in the new system. A member of the Board asked him, after the hearing, whether he felt repaid for his attendance.

"I surely do," he replied. "I see how it will help me out. I have three thousand acres in farms on the Eastern Shore of Maryland. It is beginning to show signs of decreasing fertility under the tenant system in vogue; and I can see in the future nothing but poorer farms, poorer tenants and finally a poorer landlord. I am especially interested in the landlord's end of it; though, as a good citizen, I hope I am not entirely oblivious of the desirability of maintaining the fertility of the lands of the nation, or to the welfare of the tenants. What is it the poet says?

"But a bold peasantry, their country's pride,
When once destroy'd, can never be supplied.

"All right; I'm not going to destroy 'em any more. I shall go home and prepare to sell my lands. I can within a year or two find thirty farm tenants who are the right sort of men; and, having organized a National Farm Loan Association, I shall deed my plantation away in thirty tracts, take that half of their value which my purchasers may get under the Federal Farm Loan Act, take also anything they can pay me without sacrificing their equipment, and second mortgages for the balance at six per cent."

What Land Owners Must Do

"I shall insist that they all take out forty-year mortgages ahead of me, and I shall not worry as to their digging out. They will dig out in a few years if they have good luck; and if any of them fall down it won't hurt me much. I shall have plenty of time before the first mortgage falls due in which to find other purchasers."

This man is a fair type. America has thousands of just such landlords.

At Nashville the writer, after the hearing, sat at meat beside a gentleman who turned out to be the possessor of a great tract of cut-over timberlands in the alluvial districts of Western Tennessee. These lands are of enormous fertility, but the clearing of them is no small job. Therefore, they are low in value and slow of sale.

"I came to the hearing this morning," said he, "out of curiosity; but I have been blessed with a big idea, born while the farmers were testifying. I shall sell my land out to tenant farmers—to any farmer or farm hand who can get the equipment for carrying on the development of the farm—and take a second mortgage for every cent of the half they can't pay for out of the Federal Land Bank mortgage."

"At what valuation?" he was asked; for there is no doubt that there is many a canny landowner in these states of ours who plans to sell to the Federal Land Banks by dint of doubling the price of his land, letting a buyer borrow half of the doubled price and pay it over.

"I see your point," said he. "Of course the Federal Land Bank wouldn't fall for any funny business. I'll take the Land Bank's valuation as the basis of the deal."

"You'll have to do better than that," he was assured.

"How much better?" he inquired.

"You'll have to make those tracts into real farms. You'll have to clear enough so that your buyer can make a living on the place; and you must furnish some fencing, and a house, a well, a barn, and the like. Each man should have a cow, some fowls and a couple of swine. Then it would be such a farm as the Federal Land Bank could loan upon—actually under cultivation."

"Well," said he, "all those things, except the chickens and livestock, would add to the value of the land, wouldn't they?"

"Yes."

"And form the basis for a little larger loan?"

"Yes."

"Well," said he, "I'll do it, then!"

"And," went on his informant, "if your buyers will then go on and do more clearing, thus adding to the value of the land, they can return to the bank for reappraisement, as the value increases, and get enlarged loans, so long as they do not ask for more than fifty per cent of the value. That's what the Federal Farm Loan Act is for—'To provide capital for agricultural development.'"

The Wisconsin Land Bank

This matter of negotiating loans for the development of land by clearing and then making reappraisements as the clearing progresses as a basis for larger loans to clear more lands, and so on, has been worked out for years in Northern Wisconsin by a land bank organized under a law of that state. Here, too, is shown the capacity of the Federal Farm Loan System to finance the poor man into farming affluence. This portion of Wisconsin is a cut-over region of rich lands splendidly adapted to stockraising—and this usually means, in Wisconsin, dairying. The people located on these lands were mostly foreign families whose breadwinners had worked in factories, some of them for as long as twenty years, during which time they had accumulated from two to five hundred dollars each by the slow process of laying one dollar on another in an unceasing struggle with the problem of living.

Each family had a small clearing and some such start in necessary farm animals as was suggested to the Nashville lumberman. But their clearings were not large enough to furnish a living for the family. The man of the house was obliged to "work out" in order that the family might live; and the clearing went on at the slow rate of not more than an acre a year to a farm. This is too slow for the twentieth century. Such slow progress it was that forced our ancestors to spend seventy-five years in reclaiming Indiana and Ohio; but there are too many other opportunities open to willing hands in 1917.

The cut-over lands, constituting the bulk of the remainder of our untilled area, must yield quicker returns or they will remain waste. The Wisconsin land bank has been for years financing these families in such a way as to make it worth while for the man of the present day to subdue the wilderness the lumberman has left.

When these farms were once occupied, and so far reclaimed as to give the settler a home and a mere toe hold, values went up a little. The man who owed half the value of his farm three years ago now owes only a third of it; therefore, he is able to go to the land bank, show that he is eligible for a loan of two or three hundred dollars more, and secure it by executing a new mortgage and retiring the old. This little margin of cash he uses in clearing more land, partly by dint of hiring labor or buying dynamite, and partly by using it to support his family while he stays at home and works. Ten acres more cleared, and his farm is worth five hundred dollars more; and the reappraisement is repeated.

FIRE!!!

AMERICAN-LAFRANCE CHEMICAL *On Standard Ford Chassis*

Instant Response

THE safety of your own dear ones, your responsibility as a good citizen, demand that you get complete information about this wonderful motor fire-fighter at once. Be up-to-date and SAFE. "Chemical" has 40 times the fire-fighting efficiency of water. The outfit herewith is the product of the world's greatest manufacturer of fire apparatus.

These American towns have already bought American-LaFrance Chemicals on Ford Chassis, and the list is incomplete:

Anthony, R. I.
Antioch, Cal.
Arcade, N. Y.
Arlington, Texas
Averyville, Ill.
Battle Mountain, Nev.
Berwick, Me.
Boothbay Harbor, Me.
Bowie, Texas

—that feeling of SECURITY in an emergency

A lace curtain. A spark. A flame. A telephone. A woman, tremulous—yet trusting. The clanging bell in the town fire-house. The American-La France Chemical tearing along the road like a hound unleashed, snorting in encouraging response to the woman's S. O. S. The timely arrival, discrediting the fastest horse-drawn apparatus. The fire put out before it got under way. The woman's gratitude. The return to the fire-house.

Your turn may be next. Don't wait for the fire alarm, with consequences no man can foretell. Your town now, this very minute, needs the protection of this trusty, speedy, economical life-saving apparatus. Write at once for further information. Your turn may be next.

"Keep Appearances Up and Expenses Down"—tells how to secure the best appearance with least expense. Mailed free on request. Address Dept. 5116.

PAINT DEVOE PAINT

The loaning of money on second mortgage is not a hazardous business when wisely conducted, even subject to the ordinary first mortgage. It may be that the people managing the well-known organization for aiding Jewish back-to-the-landers are more than ordinarily efficient; but they are conducting it under peculiarly disadvantageous conditions. The Jewish farmers are mainly typical greenhorns. The Jews have been for ages divorced from farming. The traditions of agriculture have departed from their blood.

The risks of the business are widely scattered, and inspection is enormously difficult as compared with the same work in the case of the Wisconsin land bank or the prospective loans of the Federal Farm Loan Bureau. The loans are, many of them, made to farmers who are absolutely insolvent. Instead of second mortgages, the Jewish concerns loan on third and fourth mortgages as well; and in some cases have advanced funds in sixth place from the bottom title! Anyone would say that they ought to have lost a lot of money; but at a gathering of Jewish farmers in New York in November, attended by nearly three hundred Children of Israel from eight states—veritable spies sent to spy out the Promised Land and the advance guard of who knows how mighty a host!—I was informed that these losses, incurred through aiding over three thousand families, have been only 2.82 per cent in sixteen years.

Had these loans been made subject only to forty-year amortized loans, and on second mortgage only, it is difficult to see how any losses at all could have been made. As a matter of fact, the debt at low interest on forty years' time is shown by the Texas school-land experience to amount to very little as an encumbrance. The Lone Star State sells its school lands on forty years' time at three per cent interest, on receiving an initial payment of ten per cent. These mortgaged lands sell in the market for very little less than unencumbered lands; and second mortgages subject to them are scarcely inferior as securities to first mortgages.

Four Per Cent Philanthropy

I have hitherto written of the financing of rural integrity and ability as a business to be done by the local capitalist only, or by the seller of lands as a means of retiring from landlordism. It was in the state of Massachusetts, however, that the first suggestion came to us that such a thing as a legally organized system for doing this work might be expected as a result of the enactment of the Federal Farm Loan Act. In that state, as in the rest of New England, there is special need of some more liberal system of farm loans in order that the agriculture of New England may be rehabilitated. A state land-bank law was passed just before the Federal Farm Loan Act became a law; but little has been done under it. It is now on the tapis in the Bay State to amend the state law so as to make it the agency for aggregating second mortgages and making them the basis of issues of bonds.

Thus, if this project bears fruit, a second land-mortgage law will be built under the first, in order that the man with little money may have credit with which to buy and time in which to pay. The plan is to deal in those second mortgages only that are subject to long-time amortized first mortgages. From North Dakota comes a rumor that a million-dollar company is organizing to deal in second mortgages of the same sort. Doubtless there will be many more projects of both kinds. Many more were mentioned at our hearings as among things planned.

And, lastly, one cannot but think of the great field which lies open here for some such philanthropy as that of the late Mr. Mills, of hotel fame. I am informed that the Mills' hotels, built for the excellent purpose of furnishing clean lodgings and meals for the almost penniless, have paid dividends at the rate of about four per cent. Where is there a better field for four per cent philanthropy than that of turning farm tenants and farm laborers, country-minded city people, and young men with farm experience and agricultural educations into actual owning farmers by giving them the money they lack at four per cent on second mortgage?

Whatever may have been the risks attendant on such a project in the past, the day seems now to have come when such a work may be entered upon with safety. In what other way can wealth serve its country so well—and yet earn four per cent?

The Road To Happiness

On the first guide-posts along this road the words "Good Health" are written. And you can never come to good health without sound teeth—the guardians of your digestion.

"A Train Load of Books"

What Clarkson is Doing for the Book Buyer

IN several hundred thousand Libraries in the homes of people in every walk of life—from the day laborer to the college professor and high government official; from the persons who buy a few books of popular fiction, to the persons who pride themselves on having the complete works of all the standard authors in De Luxe Sets artistically printed and bound—**almost every book was bought from me. WHY?** Because **I have no agents and sell you just the books you want—all new—many at a saving of from 50 to 90 per cent.** You examine the books in your own home for five days before paying for them. If not satisfied, return at **my expense—and owe me nothing.**

Sample Prices:

Eyes of the World. 38c.
Famous Pictures. $6.00, $1.45.
Encyclopedia of Quotations. $2.50. My price, 89c.
What All Married People Should Know. $1.00. 19c.
Buffalo Bill's Own Story of His Life and Deeds. $1.50—45c.
Famous Orators. $1.50; 95c.
Law Without Lawyers. Pub. price, $2.00. My price, 45c.
Shakespeare. 24 vols. 24mo. Limp Leather. $7.85.
When a Man Comes to Himself—Woodrow Wilson. 50c.
Jiu-Jitsu, or Art of Self-Defense. $1.25: 60c.
Key to the Bible. $1.75; 95c.
Library of Wit and Humor. $1.50; My price, 52c.
Huckleberry Finn and Other Mark Twain Books. $1.75. My price, $1.25.
Brann: The Iconoclast, 2 vols. Complete; My price, $2.25.
History of the World, 3 vols. $12.00; My price, $3.95.
Memory: How to Develop. 65c.
Canary Book of Health. $5.50; My price, $1.50.
New Americanized Encyclopedia, 15 vols., ½ Leather. Publisher's price, $75.00. My price, $14.75.
Century Dictionary and Cyclopedia, 12 vols. ½ Leather. Publisher's price, $120.00. My price, $19.50.
New American Encyclopedic Dictionary, 5 vols., ½ Leather. Publisher's price, $21.00. My price, $4.75.

Hervarth De Luxe Sets, Morocco bound, complete works, many of them at less than 10c on the dollar. Hugo, Kipling, Poe, Eliot, Dickens, Thackeray, Stevenson, and scores of others.

Get My Big, New Catalogue

My new catalogue, sent free for the asking, tells you **how to save 50 to 90 per cent on thousands of books.** It is a course in literature, giving nationalities, date of birth and death of authors, the author's life and standing in literature, etc. Hundreds of sets and thousands of single volumes listed.

I sell more books direct to the bookbuyer—the individual reader—the rich man who insists upon his dollar's worth—the man who watches his pennies—**and sell them for less money**—than any other man in America. Every book new and fresh, and **guaranteed** to please **you**—you to be the judge. I do not quibble, and would rather have a book or set of books returned at my expense than to have a dissatisfied customer.

Not for This Kind of Car

If a car-builder is insistent on having his car sell for a certain fixed price, he must, of course, make his selection of parts on a price basis.

Figuratively speaking, it becomes an auction where the lowest bidder, irrespective of quality, gets the business.

And that makes Timken-Detroit Axles out of the question—

First—Because it costs money to put Timken-Detroit engineering, absolutely reliable materials, and uniform, finished workmanship into motor-car axles.

And, therefore, Timken-Detroit could not hope to come out lowest in a bidding contest.

Second—Because we will not enter such a contest under any circumstances. The character of the cars that are equipped with Timken-Detroit Axles is good evidence of Timken-Detroit quality—just as their use of Timken-Detroit Axles is evidence of the car's high standard of quality. We cannot afford to jeopardize our own reputation or that of our customers for protecting the safety of the car owner.

Building a good axle first and pricing it afterward, is not, however, an *expensive* policy. It results in more value for dollars expended. It produces axles at the lowest cost consistent with the highest quality. It saves repair expense for car owners.

Nine years of exclusive devotion to good axle building has proven that that is what the most prominent and progressive car-builders are after.

As we look back over the years and recall the names of cars that have vanished, and of others that have won the confidence of the great public, there is one thing of which we are rather proud—

Timken-Detroit Axles have been subject to continuous improvement. They have never claimed perfection—but they've always been the very best we could build.

And that is why they have always traveled in mighty good company.

and the poultry industry
f its best years.

"This experience taught poultry shippers and dealers many useful lessons—with the result that to-day poultry is handled with an intelligence that has improved its quality all along the line. The cold-storage bird of to-day—dry-picked, dry-cooled and dry-packed—is a real delicacy and has remarkable keeping powers."

For one who has "kept chickens," and then finally reformed, a store sign bearing the simple legend, "Fancy Eggs, Eighty-two Cents," has a melancholy fascination. Lately I looked upon such a sign in a New York retail grocery and engaged in a brood of reflections upon the perverse way of hens, eggs and markets. The wind itself is not more wayward than the hen—the universal emblem of the spirit of contrariness. Yet this whimsical creature has a secure place in the affections of the people, because she is the author of a popular breakfast food—the most perfect piece of "package goods" ever put out. The meaty egg is not only the most delicious of foods but is the most perfectly protected from the despoiling and adulterating hand of man.

Doctor Pennington's Information

Probably there is no person in America who knows more about the egg of commerce in all its stages of perfection and imperfection than Dr. M. E. Pennington, the head of Uncle Sam's Food Research Laboratories in Philadelphia. Doctor Pennington has played the searchlight of scientific investigation upon all the dark secrets of the egg and the egg trade, and there is little in the lore of the hen and her relation to human nourishment and to the commerce of the United States that is not an open book to this authority, who says:

"What has happened to our egg crop? Certainly a whole lot! In the first place, the eggs laid last spring were not an excessive crop. Then the buying power of the country had risen and the demand for eggs was so great that, instead of the usual percentage of the spring lay going into storage, it went down the throats of the people. Apparently almost everybody in the country—man, woman and child—wanted two eggs for breakfast, could pay for them and got them. Anyhow, this was true of the average wage-worker who, before the war, was content to get one breakfast egg, say, three days a week.

"As a result, the fifty-four warehouses reporting stored eggs on August 1, 1916, when the storage stocks were highest, were nearly nine hundred thousand cases short as compared with the previous year. These fifty-four warehouses covered about sixty-eight per cent of the entire warehouse holdings of the United States. That meant a shortage of considerably more than a million cases of eggs in the whole country.

"Now the New York market reports on eggs show that the consumption in 1916 throughout the whole season was unusually heavy. From March 1, 1916, to October 1, 1916, New York used 320,829 more cases of eggs than it used during the same period in 1915. From March 1, 1916, to November 30, 1916, it increased this difference still further, using 331,794 cases of eggs in excess of the 1915 consumption. The same trend is noticed to an even greater extent in Chicago.

"About November 20, 1916, active trading showed that fancy varieties of early packings went, at wholesale, from 37 to 38½ cents a dozen. The reserve stock in Chicago, New York, Boston and Philadelphia was less during 1916 than any year since 1913. In Chicago, in 1913, storage eggs sold for from 29½ to 32½ cents wholesale, while fresh-gathered ranged from 31 to 37 cents. If the consumption of eggs continues at its present rate the visible reserve in the four centers mentioned must be exhausted before February 1, 1917. The trade output in New York for November, 1916, was about 91,500 cases weekly against 97,100 cases weekly in October, 1916, and 93,600 cases weekly in November, 1915.

"In 1914, sixteen million dozen eggs were exported; in 1916 twenty-six million dozen were exported.

"On November 29, 1916, in New York, 'fresh extra' wholesales were from 47 to 48 cents and the total receipts for the week were 29,716 cases. The receipts for the same week in 1915 were 39,799 cases. Prices in Worcester, Massachusetts, were 75 cents a dozen during Thanksgiving week. Near-by eggs in New York—the finest lots—ranged from 55 to 58 cents a dozen wholesale. The values of the greater part of the supply ranged from 45 to 55 cents, because many lots are mixed more or less with shrunken eggs. Near-by hennery browns are still very scarce, and a few buyers pay full prices for them when all new and of good size—say from 50 to 55 cents. Which means that on the New York market white eggs are very scarce, because the white egg ordinarily commands a big premium in New York, just as the brown egg commands a big premium in Boston."

This authority calls attention to the fact that the United States Department of Agriculture, Office of Markets, reports cold-storage holdings of eggs on December 1, 1916, in 238 cold storages as 2,103,869 cases as compared with 3,984,534 cases in 254 storages on November 1, 1916. The 193 storages that reported holdings on December 1, 1916, and December 1, 1915, also showed a present stock of 1,794,740 cases as compared with 2,787,802 cases in 1915, a difference of 993,062 cases, or 35.6 per cent.

Apparently there is plenty of reason why strictly fresh eggs have become almost precious.

The bloated pay envelopes of the wage-workers and the general business prosperity, resulting in greatly increased consumption, are sufficient causes.

"Last spring," says Doctor Pennington, "was an unusually long, cold spring. The egg-storage man has a habit of storing eggs whenever the weather is cool. During the summer of 1916 he stored eggs much longer than usual. Had there not been the excessive demand for eggs, we should have had our usual storage stocks."

The Federal Egg Campaign

"The quality of the egg during the past year also increased enormously by the enforcement of the Federal food laws last summer in interstate commerce. A large number of Corn-Belt states, from Dakota to Tennessee, coöperated with the Federal officials to keep the rotten egg out of commerce. This means that the large supply of low-grade eggs, which ordinarily reaches the big consuming centers and which tends to keep prices as well as quality low, did not last year reach those centers, but was disposed of back in the country where it originated. One result was that the receivers in the large markets had fewer but much better eggs. One receiver in New York stated to me that he had saved seventy-five per cent of the usual loss due to hot weather. A shipper in the West says that, according to his observations, not more than twenty-five per cent of the low-grade eggs that ought to stay in the producing section were getting into commerce. These men were absolutely unknown to each other. The concordance in their statements, which were based on general trade observation alone, is striking.

"Undoubtedly the egg campaign waged by the food officials last summer operated to increase quality and to decrease the large numbers of low-grade eggs that come out of storage warehouses during the wintertime. That was the first season of the egg campaign, but it served to show the shippers that the Federal Government meant what it said about rotten eggs in interstate commerce, and that they must candle eggs and ship only good eggs if they proposed to stay in the business. Shipper upon shipper, at the close of the season, began to look round for egg-candling devices and egg-candling knowledge, and some method by which he could refrigerate his eggs as soon as they were brought in by the farmer, and so prevent the largest proportion of deterioration, which occurs between the receipt of the egg by the shipper and by the consumer. He will also educate the farmers to gather eggs more promptly and handle them better."

Of course the springtime—when the hen turns to thoughts of filling a nest for maternal purposes—is bound to bring a measure of relief, so that the man on the moderate salary may increase his breakfast portion of eggs, like the laborer in the steel mill. This help, however, will not be of normal volume, for the reason that high poultry prices and

The name "Yale" is an accepted synonym for Quality and Service in increasing degree each year.

For nearly a half century the same principles standing for honesty and integrity have upheld Yale prestige and developed the Yale ideal—an ideal that rests upon the essentials of better goods, produced in a better plant by better workmen, under the highest standards of manufacturing practice.

The name "Yale" is on every Yale product — the maker's visible guarantee of mechanical excellence and the certainty of enduring, satisfactory service. Look for the name "Yale."

the high cost of chicken feed have caused thousands of henhouses to be swept comparatively clean of pullets which are ordinarily carried over for the spring egg harvest.

When we consider that no other country in the world is capable of producing so much "green stuff," and of spreading this supply so completely over the entire year, it must be admitted that we have developed the art of living out of a can to a high degree. The American people are immense consumers of canned foods; and when a calamity overtakes our crops which are logically destined for the cannery, the housewife of this country is sure to be heard from in protest.

To-day, however, the consumers of canned foods face a seeming contradiction of this statement. The calamity descended in full force upon the crops grown to be sealed in tin—and still, in thousands of stores throughout the whole country, the prices asked for foods in cans have not kept pace in price advance with the other necessities of the table.

In the line of contradictions it would be hard to find one of a commercial or economic character that is able to outrank this: In thousands of communities the retail grocer will sell you a can of corn, peas, tomatoes, or other "tinned" foods, at a lower price than you could buy that identical food, in a similar package, from the wholesaler if you took a carload or a trainload. In all probability this very thing is taking place in your own purchasing. If you are not buying at least some canned foods at a lower price for a can than they could be bought for on the wholesale market today, then your storekeeper does not do his business after the manner of the average retail grocer.

The explanation of this apparent anomaly is simple: The retail grocer generally contracts for his canned foods in advance from the wholesaler. If he has confidence in his own judgment and good financial standing, he will provide for all or most of his year's supply in this way by a "future" order. He expects the wholesaler to deliver a hundred per cent too. Generally he deals with a wholesaler who is substantial enough to do this, even when it involves a heavy loss. Retail grocers say that, as a rule, in the principal canned foods the larger wholesalers have kept close to their customary practice of delivering all their futures. With some articles, however, this has been impossible.

Canned Foods at Old Prices

Remember, there has been an immense shortage in all the most popular foods that are put into cans—with several of the most important the shortage has been close to one-half; also, in some of these foods there has been extensive export buying. Naturally the wholesale price has been pushed up to unprecedented points. Logically the retailers' price should have kept pace with the advance; but it hasn't—except when the retailer has stripped his shelves of cans of a certain food and has been compelled to get in a new supply on a current market basis. With the goods he bought on future, however, his attitude is quite commonly this:

"I've had to push up the price on so many things not contracted for in advance, but bought from hand to mouth, that I'm tired of explaining to disgruntled customers. Here's a chance to give them the benefit of a lucky stroke of buying ahead—and that's what I'm going to do as long as my stock of future-bought goods lasts."

Therefore, in thousands of instances the retailer is shoving cans of foods across his counter at a price for a can of several cents less than that food could be secured from the wholesaler or canner in carload lots. You may charge this to the timidity, the consideration, the shrewdness or the stupidity of the retailer—just as you please to put it; but the fact remains that, as a rule, he has not passed the advance in the price of canned foods over the counter to his customers. He is standing between the consumer and a market depleted by a short crop, an uncommon domestic demand and considerable buying for foreign nations.

Even on goods of this kind which he has been obliged to buy outside his fortunate future price he is not adding the normal margin, as a rule. The contrast between the price at which he is selling his contract stock of other canned foods and has been selling these identical goods would be too great, he thinks, to add even the profit—so he adds none. Besides, his competitor may have a few cans of the same food left from the original stock, and, therefore, this competition must be met.

It is interesting in this connection to raise the question of what has happened to the wholesale grocer and to the canner and "packer." Usually the contract or, rather, the future order by which the wholesaler agrees to deliver to the retailer a certain number of cases of canned foods within a specified time is positive, and constructed without any clause by which the wholesaler may escape in case of emergency.

The attitude of the large wholesale merchant is substantially this:

"I'm selling to a regular customer, whose trade I expect to keep from year to year. He buys not only canned foods from me but scores of other articles. Though my contract with the consumer says that in case of crop failure I shall receive my *pro-rata* share only, I can't pass this safety-first clause along to the retailer and furnish myself with a way of escape, because he would neither understand it nor stand for it. It's up to me to look out for myself when the price is made, and then take my medicine in case of trouble. He expects me to know what I'm about when I do my buying and to protect myself and him too. So I'm going to do it."

The Case of the Blushing Tomato

As a consequence more than one wholesale food merchant is filling futures in canned foods without profit, at a positive loss.

Not all wholesalers are doing this, however; probably by far the larger number of them are simply making their stock, secured from the canners under a *pro-rata* contract, go as far as possible in satisfying the future orders of their own customers, and then stopping there. At the same time there are large wholesalers who are delivering one hundred per cent on the future orders they have taken, regardless of the cost involved in "piecing out" short lines after their own deliveries from the canners have been exhausted.

Mr. Frank Gorrell, secretary of the National Canners' Association, who has a broad and intimate view of the whole field of canned foods, confesses that he is obliged to take the rôle of a kill-joy when looking into the future of this favorite source of American food supply. First, he points to the fact that the surplus left over from former stocks on the shelves of most of the wholesalers and retailers has practically been wiped out by the pressure of two years of phenomenally acute demands.

"Take the tomato as an example, because it is one of the most popular foods put into a can," says Mr. Gorrell. "The average pack in this country is about fifteen million cases. In the spring of 1915 it rained for two months straight, and then for the next two months there was practically no rain at all, and the heat was intense. The pollen was washed out of the blooms by the rain, and fertilization and fruitage were, therefore, far below normal. Consequently we had just about one-half a normal crop to put into the cans. Of course these destructive weather conditions cut down every kind of crop destined for a cannery. This shortage was felt very keenly, especially after the prosperity resulting from war orders began to show itself on the table of the American wage-earner. These two causes acted as a vacuum cleaner in removing all the reserve from warehouses and shelves of the wholesalers and the retailers.

"When the crop of 1916 came in it was at least two million cases short of the average. This was in spite of the fact that every effort was made on the part of the canners to secure an uncommonly large crop.

"In the course of the 1916 packing season a new element entered into the situation: Either because Canada had a short tomato crop, or else because Canadian buyers were sent to secure a supply of canned tomatoes for the armies of the Entente Allies, buyers from the Dominion appeared in our markets and soon sent the price of spot goods up to $1.35, when futures were bringing about eighty cents. For several weeks these Canadian buyers had a standing offer of $1.35 a dozen for canned tomatoes up in all our principal markets. Naturally this brought our own wholesalers into the competition, with the result that the price went as high as $1.45. Undoubtedly this foreign buying was for the fighting men in the trenches, because it is a matter of common knowledge that the tomato is a striking

Five Layers—Six Processes What It Means to You

NEPONSET Twin Shingles are made of five layers (six processes) pressed into a thick, solid, inseparable mass, impervious to rain, moisture, frost; undecaying and unaffected by sparks or embers. Similar materials in our famous Paroid Roofing are still giving good service on roofs laid 18 years ago when Paroid was new. A roof of these shingles, when laid, being several times as thick, should last as long as the house. But wear is not all. Here are other facts:

Beauty The colors, form, size and slate-surface of Neponset Twin Shingles make as handsome a roof as it is possible to find. It has the look of slate, laid in substantial looking large slabs. Its soft green and red colors harmonize with any surroundings or architectural plan. You can be sure of eye-satisfaction.

Fire-Resistance On a Neponset Twin Shingle roof sparks and flying embers burn out harmless. Most conflagrations spread from roof to roof. These shingles are a very great protection. They are approved by the National Board of Fire Underwriters.

Cost Notwithstanding their great beauty and durability, Neponset Twin Shingles belong in the class of economical roofings. Their uniform shape and double width halve cost of laying, because two shingles are really laid at a time; and also lessen cracks and nail holes.

NEPONSET TWIN SHINGLES

(Patent applied for)

There are three types of Neponset Shingles for every requirement and purse.

For factories, warehouses, barns, etc., similar material is furnished in rolls. It is Neponset PAROID Roofing—a roofing that for service has been unchallenged for 18 years.

There are three types of Neponset Roll Roofing, meeting every requirement and pocket book.

See the Neponset dealer in your town. He can supply you with just the product you need—made and guaranteed by us.

Send for Free Booklet, "Repairing and Building"

It tells about the different Neponset Building Products.
NEPONSET Built-up Roof for Industrial plants.
NEPONSET Waterproof Building Papers.
NEPONSET Wall Board for cottages, attics, ceilings, in place of laths and plaster.
Lumber and hardware dealers sell Neponset Products.

BIRD & SON (Established 1795) **263 Neponset St., East Walpole, Mass.**
New York Chicago Washington Canadian Office and Plant: Hamilton, Ont.

Manufacturers of Neponset Floor Covering—sold by department and furniture stores everywhere. Also manufacturers of Special Waterproof Papers, Special Paper Boxes and Fibre Shipping Cases.

ourager of scurvy, shingles and beriberi, other disorders of a similar character often assail men when they are herded ther in large bodies.

Of course these export orders were with-rn after a few weeks; but they certainly a stiff backbone into the market while were here. Incidentally it should be arked that the canners, or 'packers,' as all them, who sold futures at the aver-price of eighty cents swapped dollars, some of them were not even fortunate gh to get out on this basis.

For one thing, the packer's labor and ating costs were considerably higher. ably the average increase was not far twenty-five per cent. Certainly in localities where the canning industry tensive the increase was much greater this. His cans and his labels, like his r, were decidedly more costly."

is authority declares that he has no olation to offer the American house-so far as the future prices of canned s are concerned. For cans in which to the crop of 1917 the packer will be ed to pay ten or twelve cents more a n.

gain, the agricultural situation, so far e canner is concerned, is without prec-t. Crops for canning are decidedly ate and they also call for an immense nt of labor. From his 1916 experience armer knows full well that, so long as European war continues, the wage of the hand is bound to bear a disagreeable nblance to a king's ransom; and that e most crucial moment of crop making crop harvesting he is likely to find elf with insufficient help, even though willing to pay a reckless price for his

ith wheat at practically two dollars a el and with corn at close to a dollar a el, the farmer who has previously sup-canneries sees an easy way out of his ulty through the growing of these , which are far less delicate and un-in than those destined for the can. cially in the case of wheat the amount por required would be extremely small ared with that of cultivating the same ge of tomatoes, peas, beans or other rs' crops. Because high wheat and offer the farmer an easy way out, with isk than he would run growing for the ry, the packer sees plenty of trouble l, so far as securing anything like an ade-supply of raw materials is concerned. he future of the canning situation," ents Mr. Gorrell, "is about the most s thing we have to consider to-day in atter of foods. There is no question ver that the price of all canned foods be advanced very decidedly. There is ape from this in view of the fact that morally certain that prices have in-d fully thirty cents a dozen above and very likely more than that. the irresistible increase in cost put d foods up to a price that will decrease mption? That is a mighty big and question, and one which I cannot even pt to answer."

The Increased Cost of Cans

this matter we are going to find our-in a situation where there are few ents to serve as guideposts. Of the answer to this question hinges on er our wageworkers are going to con-o receive steady employment at high . The canner is now certain of only hings: That his costs are going to mensely increased in 1917; and that he labor reaction comes the question survival will depend very largely whether it catches him with a supply ds on hand.

do not know of one canner, who is ntial and has a good standing, who willing to name a price at which he rnish goods in the season of 1917. ks at the price of tin plate—six dol-nd a half as compared with two-or the season of 1915—reflects for a t upon the increased cost of labor, ls, and the inclination of growers for nners to go into grain raising, and oncludes that he is going to feel his ry cautiously this year. Why, it is impossible for the canners to buy te at all to-day. I am told that no te manufacturer will guarantee de-after July. Bessemer steel has gone of sight in price. Bessemer is the basis plate, and not long ago it was obtain-fifty dollars a ton, as against about a hundred and twenty now. Tin—the pure stuff—has kept pace with this advance; in fact, we are really at the mercy of the British Government for our tin and must take what it chooses to allow us to have.

"As for the price of canned foods for the immediate future, there is not a single crumb of comfort to offer the consumer. As a general rule, thus far the merchants—both wholesale and retail—have been holding the bag for him and have not passed the price increase over the counter to him. This is especially true of the retailers, and they should have the credit for it."

When it was suggested to this authority that the public was inclined to the opinion that there had been a large volume of speculation in canned foods, he answered:

"Undoubtedly there was some speculation in tomatoes in 1915; but I do not know of any speculative buying in 1916—and it would naturally have come to my knowledge if it had existed. It is important for the consumer to appreciate the fact that the attitude of the canner is naturally against speculation in his products. The reason for this is entirely simple—the speculator stimulates a false demand and confuses the market. Again, when it comes to selling he is a demoralizing factor. The selling of legitimate futures to wholesalers, who, in turn, sell futures to their customers, is absolutely necessary and the only practical system by which the demands of the consumer may be met."

The Part of the Speculator

"This, it seems to me, should not be called speculation. Speculation occurs when a man who has not a clientèle which depends upon him year after year for its supply of canned foods jumps into the market, buys a big lot of goods, and puts them away in a warehouse until he thinks the psychological moment for dumping them has come. Then, instead of dealing them out to an established trade, which will forward them along on their way to consumers, these goods hit the market with a dead weight; and the result of the blow is bad for the whole canned-food industry from start to finish. For this reason the canners are strongly opposed to the speculator. I do not know of a single high-class canner who will sell goods to a speculator if he knows it.

"I know of a man, for example, who decided a few years ago that tomatoes offered a good chance for speculation. He had plenty of capital and could pay cash for all he could buy. He received the jolt of his life when he took his money into the market and could not buy the big block of goods he was after. There is no 'Welcome' on the doormat of canned-food industry for the speculator; his confusion and unsettling influence are not wanted there."

Remember, the tomato has been taken merely as a type of all canned foods in the vegetable and fruit lines. The destructive weather conditions which cut down the tomato crop devastated all other crops intended for the cannery, and in some cases wrought a havoc greater than that which reduced the tomato production of 1916 to about fifty per cent.

There may be an optimistic consumer who is inclined to suggest that, as fish do not grow from the soil and are not influenced by either excessive drought or rainfall, the tin can containing salmon ought to afford a cheering exception to the general atmosphere of gloom. But the answer is that it does not. According to the authorities the salmon pack of 1916 was just about one-third short of what it should have been. The one ray of consolation in sight is that the big run of salmon is due this year. In other words, the sockeye salmon runs every four years, and the last run was in 1913.

The baked bean is one of the most popular of canned foods, and Nature was just as unkind to the bean crop in 1916 as to all the other cannery crops; and in addition to this there has been an immense exportation of dry beans to the fighting men in the trenches. The navy bean in its natural dry state is a very condensed and extremely portable food, and for this reason export demand has been almost insatiable; and beans normally bringing a few cents above two dollars in Michigan can now command about six dollars. One country grocer went behind his counter and brought out a quart sack of navy beans, took out a handful and, as he poured them back into the sack, remarked:

"At the present price they are something like pearls! At the beginning of the season I placed a future order with a wholesale

Nick and Pull!

See the point?

With a Blaisdell pencil just "nick" the narrow strip of paper between perforations and "pull." Your pencil is sharpened, quick as a wink and clean as a whistle. No time nor lead is wasted by whittling. No soiled hands nor littered floor.

And *such* pencil satisfaction!

The perfectly balanced, friendly "feel" of the Blaisdell makes writing a joy. With minimum pressure the Blaisdell writes clearly and wears slowly. Superior, gritless leads mean quicker, cleaner work, and happier workers.

"Nick" and "Pull" will work for you and pay you well for the privilege.

"Nick" and "Pull" are efficiency experts—they guarantee better pencil service at lower pencil cost. They are eliminating fuss and muss, and are saving money, for millions of Blaisdell users. *Why not you?*

Blaisdell Guarantees PENCIL Satisfaction

Are the world's largest pencil buyers all wrong?

"Nick" and "Pull" are cutting down pencil costs for practically every large business house in America. Here are a few large users of Blaisdells:

United States Steel Corporation
Pennsylvania Railroad Company
Ford Motor Car Company
American Tobacco Company
Westinghouse Electric Company
Bell Telephone Company of Penna.
Western Union Telegraph Company
New York Central Railroad
William Cramp & Sons Ship and Engine Building Company
Bradstreet Company
New York World
duPont Powder Company
Standard Oil Company
General Electric Company
United States Navy
Carnegie Steel Corporation
City of New York
City of Chicago
Prudential Life Insurance Company
State of Pennsylvania
New York Life Insurance Company
Chicago Tribune

You can profit by *their* experience—*use Blaisdells.*

The Blaisdell line is complete—there's a Blaisdell technically and practically perfect for every pencil purpose. Regular, Colored, Copying, Indelible, Extra Thick, China Marking, Metal Marking, Lumberman's, Railroad, etc. All standard grades and degrees of hardness.

Blaisdell pencils are guaranteed to have perfect leads of highest quality and to be satisfactory in every way. Any defective or unsatisfactory pencils will be replaced, or are exchangeable, through your supply house or direct, for cash at full purchase price.

Blaisdell 202, with eraser tip, is specified by all who appreciate a superior, long-wearing, ever-ready, smooth-writing, general purpose pencil. 60c a dozen, $6.00 a gross.

Blaisdell 151, blue pencil, leads the world in quality, outsells all other blue pencils combined. $1.10 a dozen, $10.80 a gross.

Blaisdell's spun glass Ink Eraser has earned universal popularity. "Nick" and "Pull" keep it ever ready and ever clean. Takes out blots in a jiffy. A delight to all who write. This perfect all-purpose ink eraser at 10c outlasts three ordinary erasers.

Let "Nick" and "Pull" go to work for you TODAY. Your stationer sells and recommends Blaisdell pencils.

house for a large quantity of navy beans. The other day this quart sack came, with the information that it was my *pro rata* from the stock in the hands of the wholesale house with which my order had been placed."

The family milk bottle has by no means been immune from the fearsome attacks of the H. C. of L.; in fact, everything in the food line for which the cow is responsible has suffered a boost of price well calculated tomake children shudder and household providers hide on the first of the month. With the ordinary milk of commerce selling for nine cents a quart in the city and eight cents in country towns, it is evident that something has happened in the cow stable as well as in the tomato, the potato, the wheat and the corn field, and on the cattle range.

The high cost of living for the cow is no mere figure of speech. The writer happens to live where spotted Holsteins are the prevailing landscape decorations and the menu of the milking herd is a standard and exciting topic of conversation. Just now a mention, for example, of the feeding grains is enough to drive a dairy farmer to strong language. Thirty-six dollars a ton! And when he buys he invariably remarks that it seems only yesterday when twenty-four dollars was a top price for this bovine breakfast food.

The Sensitive Milk Market

Brewers' grains that brought twenty-four dollars a ton in 1914 are now costing the farmers of Kane County, Illinois, about thirty-three; and wheat middlings have advanced at least nine dollars a ton since the war began. Certainly this should be sufficient to suggest why the nation's milk, butter and cheese bill has become swollen to its present sensational proportions. So far as diligent inquiry is able to reveal, there are no two dairy farmers in America who are agreed upon how much it costs to produce a quart of milk, with feed at the present prices. One farmer, who keeps careful records and is an able manager, is able to show by his books that it cost him, as a year's average, an invisible fraction of a penny less than five cents a quart to make milk when he bought brewers' grains for winter feeding at twenty-six dollars a ton.

Probably there is no other food necessity that responds more sensitively to a change in general financial and labor conditions than does milk. When times begin to tighten a very large body of consumers cut their allowance of milk in half, making a pint serve where they formerly used a quart. This is the statement of the largest milk retailing concern in America. This means that in the period of the fat pay envelope and the munitions orders from warring Europe the pressure of domestic demand has been beyond all precedent. Though the volume of this demand has been immense, it by no means represents all the pressure that has been put upon the American milk bottle. The call for canned milk for the fighting men in the trenches has been loud and insistent. The president of one company puts it this way:

"Right now there is a demand from Europe for half a million cases of condensed milk—most of it for army use. Exports have, of course, been very heavy."

One of the keenest observers of the American butter market is Mr. William Taber, of the New York Price Current, who makes this interesting comment:

"The butter industry of this country is constantly following the advice of Horace Greeley and the Star of Empire, and moving westward. To-day we get very little butter from New York State. Practically all of this supply comes from the Middle West and the Far West. Last week, for example, we had five carloads of butter here from California, and it was as good and golden as the state from which it came. Colorado, Idaho and Montana are fast joining the ranks of the commonwealths that contribute butter for Manhattan's bread. In 1915 forty-five new creameries were started in Montana.

"When the American wageworker is getting good money, and getting it regularly, he wants to see a good share of it on his table; and he is especially inclined to celebrate his prosperity by spreading yellow butter over his bread. Consequently in our present period of the loaded pay envelope the pressure of increased home consumption has been keenly felt in the butter market. This led to a most interesting development—the determination of how high a price we shall pay, at a time of high-tide prosperity, for good creamery butter.

"I have been watching this market for thirty-nine years and have never before known butter to reach forty-two cents and a half before the break came. Then it fell five cents in seven days. Literally hundreds of stores took out licenses to sell oleomargarine and butterine; and this sudden stampede to the standard of the butter substitutes signalized the fact that the point had been reached at which the consumer would not stand for another cent of increase. This breaking point in butter has often been determined before, but it has never been at so high a price as that recently found by the prosperity test of 1916.

"Before the outbreak of the European war we were importing Danish butter of wonderful quality. To-day England is coming to the United States for butter. For example, between the first of September and the latter part of December, 1916, we sent 235,000 tubs of butter, averaging sixty pounds to the tub, across the water from this port. Large quantities have also gone out from Boston, St. John's and Montreal. In short, we have exported more than 23,000,000 pounds of butter inside of three and a half months.

"On December 1, 1916, the volume of butter in fifty-four associated warehouses was 52,586,000 pounds, or more than nine million pounds short of the previous year's reserve on that date.

"Is it any wonder, in view of all these facts, that butter, in big lots, reached the record price of forty-two and a half cents? This seems almost unbelievable, however, when I recall a period at which, for ten consecutive weeks, the price of the finest creamery butter in this market stuck at fifteen cents a pound. This means that the farmer received only eleven or twelve cents a pound for his product. As a rule, the jobber to-day takes a toll of about two cents or two and a half cents a pound for his service and investment in distributing to the retailer, who, in turn, adds four or five cents for his labor and investment. These margins appear to me to be entirely reasonable."

The Sugar Situation

The whole story of the sugar situation may be suggested by the statement that Europe has made continued and heavy raids upon the American sugar barrel. Our average annual export of refined sugar for the years 1907 to 1913 inclusive was 31,910 short tons. In the calendar year 1914 the United States' export of refined sugar amounted to 195,205 tons; in 1915 it amounted to 481,669 tons; and in 1916 the Department of Commerce estimates that 800,000 tons of refined sugar were exported from this country. In 1907 the United States consumed 3,353,256 short tons of sugar and exported 11,662 tons—that is, we exported but 0.35 per cent of the amount of sugar we consumed. In 1916 the United States consumed 4,097,741 short tons and exported 800,000.

When we analyze the figures which show that in 1916 we exported twenty-five hundred per cent more sugar than the annual average of seven years prior to the outbreak of the war, we cannot fail to realize that this large increase in our exports must necessarily increase the price of sugar to the American consumer.

Before the outbreak of war in Europe about one-half the world's production of sugar, exclusive of India, was derived from beets. The world's crop of beet sugar is produced almost exclusively in Europe and the United States. The leading European countries engaged in the production of beet sugar are Germany, Russia, Austria-Hungary, France, Belgium, Holland and Italy. Cut off by the war from 73.5 per cent of her annual sugar supply, England turned to the nearest available market, New York City, to supply this deficit. Within a few days British buyers raised the world's market price of sugar three cents a pound and bought almost two hundred million pounds of raw and refined sugar.

As a consequence of this action on the part of Great Britain the New York wholesale price of sugar rose from $4.16 a hundredweight on July 30, 1914, to $7.35 a hundredweight on August twentieth, an increase of more than three cents a pound in three weeks. Early in October, however, England began to withdraw from the buying market and the wholesale price declined until, in December, it dropped to $4.75 a hundredweight—only a little higher than the average normal price.

We Have 95 Per Cent of the Business

Innovations come in the Speedometer business—and innovations go.

And through the haze of new ideas, new schemes, and new failures, the wonderful success of the Stewart Speedometer is even more conspicuous than ever.

Today the Stewart Speedometer is used as standard equipment by over 95% of the car manufacturers. And this—in spite of the fact that the Stewart is the most expensive speedometer built.

No other automobile accessory has ever received so unanimous an endorsement.

Motorists have learned the value of having the best equipment on their cars. They have found it worth while to be protected by Stewart workmanship, Stewart quality and Stewart nation-wide service.

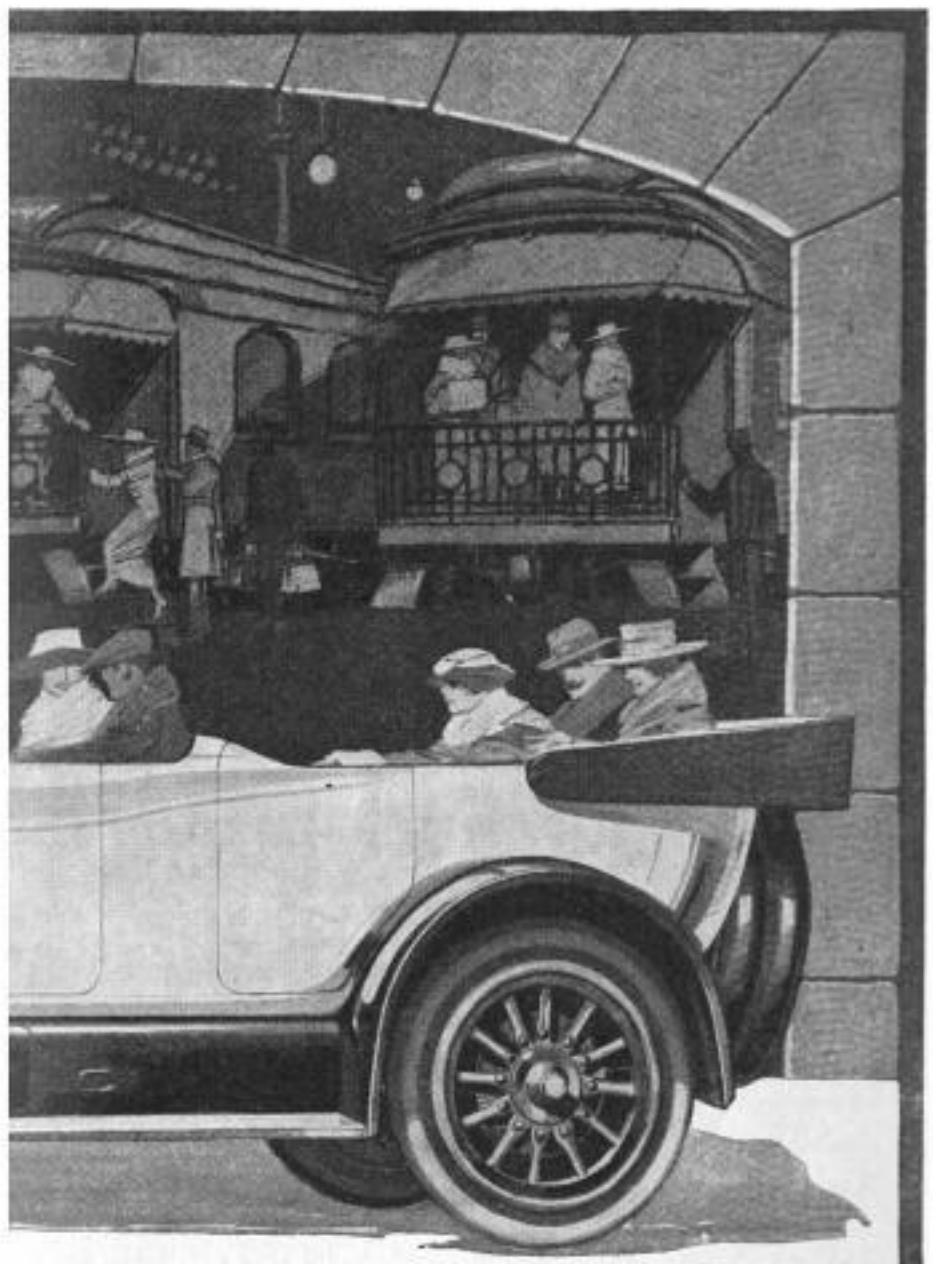
Take the Stewart Vacuum System—*the* system that insures a smooth, positive flow of gas to the carburetor. It is now used on over 70% of all makes of cars and will soon be on every car built.

The Stewart Tire Pump is also standard equipment on many well known cars. And thousands are sold each week to individual car owners. It does away with that laborious, back-breaking work of pumping by hand, and makes it easy to keep tires properly inflated.

Stewart Warning Signals—motor-driven or hand-operated—are the best known and most used signals on the market. They are absolutely dependable—always ready to warn with loud piercing commands. They have no superiors in finish and appearance.

The Stewart V-Ray Spark Plug—the newest Stewart Product—is already in great demand. Its four sparking points mean four times longer life and a big, fat spark under conditions that would put ordinary plugs completely out of business.

The Stewart Speedometer for Fords is the most popular of the many Ford accessories now built. It costs $10—or mounted in a handsome special cowlboard of enameled steel—$11.25.



Such successes cannot be excelled in any line of business. Each Stewart product has won instant popularity on its own merits.

Insist upon having Stewart Products on the next car you buy.

Stewart Products are for sale by leading jobbers, accessory dealers and garages everywhere.

Stewart-Warner Speedometer Corporation, Chicago, U.S.A.

t Extravagance

IT is a *permanent* pleasure to spend the cost price of a National "Highway." After the first flush of having the new car delivered to your home, there are no after-regrets; no doubt about the wisdom of your choice; no wondering if you suffer in comparison to your motoring friends.

Mother and daughter cannot ask for more beauty, luxury or social prestige; the son cannot ask for more power, speed and thoroughbredness; while for father who pays, it is endless satisfaction not to have over-spent. Even more important is the conviction that grows the longer he drives his National that it was cash-wisdom not to *under-spend.*

Furnished in Touring Car, Four Passenger Roadster, Phaeton, Coupé and Touring Sedan, in both Six and Twelve Cylinder Models

To Dealers: Some excellent territories still available. Others now subject to revision.

THE HOUSE OF CRAIGENSIDE

(Continued from Page 25)

We were off, plying the oars like mad-
ien. A choppy sea swelled under us; we
ere soon wet through. From time to time
turgis turned to catch again the direction
f the chase.

"He's turning the point," he said; "go-
ig beyond the dunes. The tide will be
orsing it again in half an hour. Now—
ake purchase."

Again we bent to it, and after much buf-
ting rounded the Horn—so we referred
) the outermost dune.

"There he is," said Sturgis, standing up
the boat. "His engine has stopped—he
nearly aground."

The Fra Diavolo had blown broadside
ward the dunes.

"Why, he's not in her!" I shouted.

"Have your gun handy," returned Stur-
s. "He knows he is pursued. He may be
ouching in the bottom. Look out for
m—I believe he is deadlier than a king
bra."

I drew out my revolver—a present from
e county. Sturgis took a few more strokes
ith the oars, and in loud tones I called
on Mr. James Smith to surrender his
rson.

There was no answer from the Fra Di-
olo. If he were still aboard he must be
ing flat in the bottom of her. Again I
outed to him that he must give himself
). But on the heels of that Sturgis struck
s our against some half-submerged object
the water. He cried out, breathlessly,
d I had an instant's vision of the thing
it slid off the blade of the oar. It was the
ad of Mr. James Smith's scarlet puppet.
Sturgis threw down his oars and brought
e thing in dripping, with a piece of kelp
nging to it.

"Fool—fool that I was," cried Sturgis,
aring at that hideous chalk-white face,
hich he clutched in both hands. "Why
dn't I examine this mechanism before we
him take it! But who could have fore-
en that he would slip away like this?
ok for the rest of the body."

We looked in vain. The thing was neither
the surface of the water nor in the Fra
avolo. That boat we found empty;
re, we found the flywheel gone, unshipped
d flung overboard, of course.

"Sunk with the manikin," muttered
rgis in a gloomy voice. "We shall never
to the bottom of this now."

"The man has drowned himself!" I
ed, astonished.

"I don't know," returned the boatman.
pointed to the dunes in a terror-stricken
y. "He may have gone ashore. Be
ick! I am in a terrible predicament for
tain."

The boatman was as white as the head
ich he still held twisted in his nervous
gers. He looked hauntedly at the empty
, at the great dunes shining under the
on, at the motor boat rolling in the
ugh of the sea.

"Put her nose in the sand," he cried.

We grounded a moment later, towing the
Diavolo, and shoved both boats high
on the beach. The tide was at the slack,
there was a wide margin of wet sand
which the surf pounded and lashed out
es of footsteps in a twinkling. The dry
d beyond was so soft as not to take a defi-
imprint. Nevertheless, on impulse we
an to run in opposite directions along
shore; but we saw no track of our
rry, and presently came together again.
The wind was coming in heavier and
vier gusts, with a great thrashing sound
ong the sea goldenrod as it came breez-
through the lowermost ravine. Parti-
of sand were driven into our faces with
ging force. Wrathful by reason of this,
loped back and forth, like hounds fairly
the scent.

"Let us strike inland," panted Sturgis.
hat is a chance at least, and better than
nding here like fools."

"As you please," I said. "You seem to
e made a great fool of me already."

"It is a long story," he said over his
ulder, beginning to run.

"And a tall fool, no doubt," I said vi-
sly, plowing up the sand in his wake.

We ran first up a great seaward slope of
rvelously sifted sand, quite free of shell
ticles and gravel and very yielding to
foot. Reaching the summit, we saw far
he left the white columns of the Craig-
ide house, and the rough blue surface of
river, flecked with white caps under a
perfectly clear and at the same time
stormy with wind. At our feet the leading features of the dunes lay spread, obscured and made a whirling ground for miniature sandspouts which moved off the tossing crests in rapid succession. The lines of the dunes, however, when we could see them plainly between these assaults of the sand, had the distinctness to be expected of their barren bulk, and so the shadows cast by them were sharp and black and of the weirdest possible design. From this vantage point those sphinxlike eminences seemed to have been deluged in a sea of ink. With their long ravines, odd distorted shoulders and fissurelike cavities, they lay at our feet like the shining ghost of Arizona bad lands.

"The jig is up," Sturgis said despairingly. "Even if he came ashore, we two shall never find him here alone."

He pointed a shaking finger at the three major folds or convolutions in the sandhills, where lone vegetation had found sufficient holdfast to thrive. In these folds three separate forests had established themselves, growths of pine, poplar, birch and scrub oak, which had thrust down their roots here through many generations with the automatic tenacity of things doomed to periodic extinction. These trees, where they were still normally above the sand tide, stood in shallow bogs or lagoons. The water glimmered among their dark boles scarcely ever ruffled, for they served as a windbreak; and the presence of this water anchored to some extent the sand below it. But nothing could permanently check the onward march of the dunes. The sand action had before now made itself felt on woods as thick as these and destroyed children of its own nourishing, throttled them by rising gradually so as to girdle them high up the trunk and rot the bark away. The pine needles to be seen here were for the most part red, the cones black and shriveled; scarcely anywhere was healthy growth to be observed. The prematurely devastated boughs served as vast rookeries for herons, cranes and crows, which were dislodged in raucous thousands at the first step of the intruder.

The trees were in three typical situations: Those still rising to a good height out of the protective film of water; those which by the resistless swelling of the sand had been almost wholly buried, their blasted tips alone remaining to show the process of suffocation which had gone on below; and finally, those which had emerged, in places where the wave had passed, revealing, as the bones of a once-living vegetation, regiments of ghastly rotted stumps with foreshortened limbs crazily gesticulating. The first would still afford a very tolerable shelter, and nothing but an energetic posse would suffice to run to cover any quarry which had sought concealment amid the damp glooms of its complaining rookeries.

"He has slipped through our fingers pretty handily," said Sturgis, pausing with something like a sob in his throat. "I am at my wit's end, I tell you. I don't know which way to turn. Going it blind, we are certain to betray ourselves to him."

"Still, there is no help for that," I said. "Suppose we take a line for the lighthouse, and trust to blundering on him in one of these hollows."

My extraordinary boatman groaned "As you say," and began to run forward at a breakneck pace, through a tangle of straggling vines, now crashing through dense growths of sea goldenrod, and again running on sheltered white flanks of the purest sand without vegetable features of any sort. Here the impress of the wind was plainly discernible; its revelries were stamped in flowing lines expressive of untrammeled speed, like mænadic lines of streaming hair. In places, too, the action of the fierce rains, which from time to time drove across the dunes, was visible. These rains, rushing in freshets from the tops of the dunes, had sifted out the sands, and evolved long bronze striations running toward the pools which lay between them. In calm weather these pools lay like flashing mirrors; the sand, dark and damp at their edges, by insensible shadings growing white near the rim of the bowl which contained them. At each instant I expected we were to come within striking distance of that sinister figure, brought to bay at last; but always I was disappointed.

"It's no good," said Sturgis, pulling up at length. "He must have drowned himself after all. And yet—I wish I could be sure of that. I tell you, Weymouth, I am

When the Rattlesnake Struck

This is the beginning of one of the stories by

O. HENRY

For years now you have read of O. Henry—you have read these advertisements and thought that some day you would own a set for yourself. And you have put off the sending from month to month. The time for that is gone. **Now—today**—you must order your set of O. Henry to get the low price and the Kipling FREE.

So great is the popularity of O. Henry—so enormous is the demand for his books—that we should like for all time to offer you the sets at the present low price. But we can't. It costs forty per cent. more to make the sets now than it did. Paper costs more—ink costs more; binding costs more. So the price has to go up. But to give you one more chance to get the present price, we have put off the raise in price till March 5th. That is the last day. Send the coupon now and be in time. Never again will you get a set of O. Henry at the present price.

MARCH 5th Last Day of Low Price on O. HENRY

"These are O. Henry days. With so much else that should absorb us—with Emperors dying almost unnoticed, with twenty million men struggling on a dozen 'fronts,' with the cost of living gripping at our vitals, and with the mad diversion of the New Luxury to hold us back from thinking of anything at all—we are all thinking and talking of the man who called himself O. Henry. Our neglected author is dead in his grave, with scarcely a publisher to walk behind his hearse, and lo! six years after his death he is bursting upon us afresh, as it were, with all the splendor of a rising genius."—*Stephen Leacock.*

Don't get him to read him once—you'll read him a hundred times—and find him each time as fresh and unexpected as at the first. He puts his finger on the pulse-strings of your heart and plays on them to your delight and your surprise. That is the mystery of O. Henry—his power beyond understanding.

KIPLING 6 Volumes 179 Stories FREE

Before the war started Kipling easily held place as the first of living writers. Now we know him to be greater than ever. For in his pages is the very spirit of war. Not only the spirit of English war, but the spirit of all war regardless of nation or flag—the lust of fight, the grimness of death, and the beating heart of courage.

451 Short Stories—2 Long Novels

O. HENRY 12 volumes bound in green silk cloth and gold. Gold tops; illustrated; 274 complete stories; one long novel.

KIPLING 6 volumes; 179 stories and poems; one long novel; red silk; gold tops.

Only a Few Days Left

Up—Up—up—goes the sale of O. Henry—higher and higher every day. 1,600,000 in the United States alone. How many thousands in Australia, France, England, Germany, Africa and Asia, we cannot tell. And you can have the books on approval, at the low price—with Kipling free.

This is your last chance to get O. Henry at the low price. Don't miss it. Remember one day's delay may make you too late. Be sure your coupon is mailed on or before March 5th. And the best way to make sure is to mail this coupon right now.

Don't wait. Send the coupon now.

in an ugly fix; and you, too, for that matter, by my fault."

The creaking limbs of a choked pine threw down shadows on our faces; our own shadows went streaming out across a patch of billowing whiteness at our feet.

He looked about him warily. We were in an angle sheltered from the wind, but the sand still hissed on the crests of dunes and rose in tawny plumes against the pale night sky.

"Well," I said, "what is this mystery? We have evidently hunted a man to his death; and if he has drowned himself, that is evidence enough of guilt. But in God's name, then, in what did this guilt consist? Why did you let him go, only to close with him again? The thing he threw in the river was certainly of straw."

"Was it so certainly?" said Sturgis.

He passed a hand across his face. We stood motionless, confronting each other, and the moon floating over those dunes seemed as large as a washtub.

"Was there nothing strange about this business?" he demanded, facing me with his legs well apart and his arms folded. Our situation by night among those rival dunes made his low voice portentous. His smoky eyes were full of smoldering blue fire. The student, the dreamer, was at last awake. He appeared shaken to the heart and yet absolutely certain of himself.

"The agitation of that girl—was this nothing? I turned several times in my seat to watch her. You were beside her. Had she the look of a woman watching a thing of straw?"

I sank my fingers in his shoulder.

"Do you know," I cried, "the words that fell from her lips when the lid to that infernal box was removed? 'It is he!'"

"'It is he!'" breathed Sturgis exultantly. "This makes for certainty. 'It is he!' Who, we do not know; but at any rate a living man. She saw in that ghastly countenance the features she instinctively recognized—the partner of Smith; and we know that she thought herself in deadly peril from that fellow."

"But—man alive—the puppet! You have fished it out yourself. What remained for us to do? What possible alternative——"

"I tell you frankly I do not know," said Sturgis in a somber voice. "We ought to have examined the mechanism, of course. We might have ascertained in a few minutes whether that thing could be worked—I mean, whether it was even plausible. It may have had no works at all inside it. I was naturally in a hurry."

He hit his forehead sharply with the back of his hand.

"There is some deeper and darker solution to this business than we have any notion of as yet. Deep below deep. It is conceived with the infernal cunning and with the deep simplicity of a mind essentially Oriental in its nature—a man that lays hold of the fantastic to mystify and to befog the issue. As soon as I saw that this chap to-night was our ornithologist, and no other, I was on my guard at once. I watched the face of that manikin like a hawk, because I knew that under the influence of hypnotic suggestion the features would be absolutely rigid. You might have thrown a double fistful of cayenne into the thing's face, and, assuming it to have been a man in a trance, it would not have so much as blinked."

"And yet ——"

"Wait!" said Sturgis. "My fascination got the better of me, do you see? when I saw the deadly interest that dark woman behind me took in the performance. It seemed to me that we had something here beyond common—I couldn't guess what. Now I had been playing with a little penknife. On impulse—— Well, as the thing passed me in the aisle I jabbed it in the leg."

I gasped.

"You jabbed it? With what result?"

"Not a quiver. Not the slightest expression of pain."

"You see? Damn it ——"

"But when I drew back the knife *there was blood on the blade.*"

He held out to me a small penknife with the blade open. There was a dark stain on the tip. Ice was in my veins then. I stared stupidly at my companion.

"Blood? Blood? Then it was a man?"

"What were the words of the girl? She cried out 'It is he!'" said Sturgis. "Now I come to another point: That girl, you notice, didn't follow you to your confounded lunch counter. She followed Fuller and me in her canoe. I was not aware of this until just as I was pulling that scarlet mockery out of the water at Hodder's Point. She came out of shadow like a flash, and cried, 'Is he dead, then?' And I never want to hear more despair in any human voice. 'Dead?' I said to her. 'Yes, dead enough. It's made of straw.' I held it out to her, and I tell you she was as genuinely amazed as any of us. Up to this point she had known something—she had the advantage of us; but this puppet threw her off the scent entirely. She gave me a wild sort of stare, and said 'Why, so it is.' Then she turned the head of the canoe toward the Craigensides' pier."

We stared at one another.

"I'm a scared man," said Sturgis in a trembling voice. "I ought to have spoken of this. I ought to have warned you not to let him go."

"You had," I rejoined grimly.

"But I wanted to see," pleaded Sturgis, "where he was going—what he would do if he thought the shadow of suspicion lifted. It didn't seem possible that he could streak out of our clutch like that. I never gave that motor boat a thought."

"Well, the horse is out of the stable," I said. "And here's another thing: Having arrested him in the name of the Commonwealth, I had no right to let him go. You understand that, I suppose. It would take a court order to free him legally. I shall be facing a serious charge when this transaction comes to light."

"Still, he must have drowned himself."

I came closer.

"Sturgis, do you think for one instant that that fat jellyfish has thrown himself overboard?"

"I do not," he replied, lighting a cigarette with shaking hand.

"Nor I."

"Then he must be here."

"We have failed to find him."

"Perhaps he was met off the horn in another boat."

"A submarine then. The coast was clear when we came on the scene. There hadn't been time for the fastest power boat to disappear."

Sturgis looked toward the jagged cliffs beyond the dunes.

"He has dodged us through these sand cracks," he said. "And now I suppose we have got to set half the county on him to root him out."

His eyes fell on a black bulk rising against the white line of the dune.

"What is that thing?" he whispered.

"The tomb of the Craigensides."

"Ah! That old devil in his tomb may be behind all this. I bet you this affair had that old ghost anchorage fairly at the bottom of it."

He glared at the house, whose white pediment rose over the shoulder of the dune. I turned my head in time to see that flock of fat gulls pass over the roof of the house, shrieking. I thought it strange that they should fly by night, and I fancied I saw at their head that grisly bird with the loop of black cord hanging from its neck.

That crimson knife end was too much for self-constituted detectives to carry on their consciences. On the following morning we made a clean breast of the matter to the authorities at Dockport; and in the afternoon a slim, clean-shaven little man presented himself, with a card from the county attorney. The name of our detective was Hawley.

"Young men," he said, twinkling, "I don't mind telling you that you are in bad odor at headquarters on account of this delay in notification. You let the fellow slip, I understand, under the Cat and Mouse Act—intended to nab him right away again, of course."

"Of course," assented Sturgis with a gloomy brow.

"Excess of zeal—what? Excess of zeal."

Sturgis began to explain, but our gentleman waved his hand.

"The facts," he said; "first and before everything, the facts. Have a conscience for the facts."

So we told him the facts. As he listened he tweaked his nose from time to time and tapped pencil on pad.

"Have you grappled for the body of the supposed victim?"

We had, with the first tide that served.

"Without success?"

"Without the slightest."

"And no further trace of this curious straw figure, I suppose?"

"Not any. The flywheel was probably securely knotted to it."

That Film on Teeth

The Source of All Tooth Troubles

By William M. Ruthrauff, A. B., A. M.

All Statements Approved by High Dental Authorities

Why Teeth Discolor and Decay

Why Germs Breed Around Them

What you already know is this: Despite all your brushing, your teeth still discolor. Tartar forms on them, so they need frequent dental cleaning. And some teeth still decay.

You know that what you do, and what you use, fail to really keep teeth clean. The old methods don't protect you. So there must be something wrong.

The trouble lies in a slimy, ever-present film which you feel with your tongue.

That film is where the stains lodge, spoiling the teeth's whiteness. That film is what hardens into tartar.

That film is what holds food particles. There they shortly ferment and form acid—the cause of all tooth decay.

And that film is where the germs breed—the germs which cause countless troubles, including pyorrhea.

Thus the chief object of teeth-cleaning is to keep rid of that film. And that is where old methods fail.

Feel your teeth with your tongue, however often you brush them, and you find that film still there. Every discolorment proves it—every evidence of tartar. But between the teeth and in crevices is where it accumulates most.

It is now known that alkali hardens it. So many applications do more harm than good.

And we can't combat the acids or destroy the germs while that film remains to protect them.

That is why many methods of teeth-cleaning fail. They remove only the loose débris. That is important, but water alone will do that. The great need of a dentifrice is to attack that film. For, day and night, harmful things are being held by that film to the teeth.

That, in all probability, is your situation unless your dentist has already told you of Pepsodent. You rely for your protection on periodic dental cleaning. But Pepsodent now assures you clean, safe teeth—teeth that long stay white.

For now science has solved this film problem. And this is to ask that you prove it by a one-week's pleasant test.

Now There's a Way To End It

To Keep Teeth Really Clean

Three years ago a way was found to keep the teeth free from this film. Those three years have been spent by dentists in proving the fact beyond question.

There have been many false theories of teeth-cleaning. Many ways which seemed good have proved worthless—in fact, are now known to be harmful. So we waited three years to let dental authorities prove that this method was right.

The film is albuminous matter. That fact suggested pepsin, which is albumin's digestant. Pepsin is known to digest albumin, and that means its dissolution.

But pepsin is inert until activated. And the activating agents are acid. The usual acid is destructive to the teeth. So pepsin for long seemed barred.

Then an acid salt was found—a neutralized acid—which does not harm the teeth. In fact, the teeth themselves are largely formed from it. This acid salt will activate pepsin. It is this discovery which has solved the problem of that film.

Pepsodent combines pepsin with this activating agent. The purpose is to dissolve the film so that brushing will remove it. Five governments already, by granting patents on this combination, have recognized its newness and efficiency.

Pepsodent is now supplanting all former methods of teeth-cleaning. It has been subjected to thousands of clinical tests. Its results have been proved beyond question.

It has won the endorsement of authorities who are recognized all over America. And countless dentists in their practice have proved that it does what they seek.

Now, on their advice, we are telling the facts to you.

This is to urge you to make a one-week test. The coupon below will bring you Pepsodent for it. See what it means to you.

Note how clean your teeth feel, even after one application. Note how quickly the slimy film disappears, how your teeth grow whiter. And how they soon feel as they feel after a thorough dental cleaning.

Mark how pleasant its use is, how unique and complete its effects. One week will forever convince you. You will never return to any method which leaves your teeth coated with film. Cut out the coupon now.

f hand. Who could have thought ——"
Yes, sufficiently bizarre," said our
d. "Still, your friend with his bloody
point—his knowledge might have
ied him, I should think."
Oh, I'm a fake detective, I grant you,"
Sturgis bitterly. "And yet, look here:
s convinced that he had killed a living
. I was as sure of it as of anything in
ife. But what was the evidence? We
no body, and what is more, we might
ucceed in finding one. The tide horses
just there, at an incredible rate; if that
had been adjusted to float just sub-
ed, it might have been carried out to
ith its occupant. To have ripped open
puppet would have been to put the
upon his guard. To let him go off with
suspected might lead him into some
ying action. If it hadn't been for that
d motor boat ——"
awley nodded sympathetically.
As it stands then," he said, "everything
gave rise to this excitement has van-
l like the mist of morning: the criminal
his victim, and all his apparatus—in
, the crime itself."
Do not forget this," said Sturgis grimly,
ncing his knife with the blade open.
No, certainly not," said Hawley. He
ided his hand for it.
We ought first to submit that to an ana-
al chemist, to see if it is in truth blood.
puppet may have had some animating
in its veins, for all we know."
But, then," cried Sturgis, "do not forget
trange behavior of the girl."
Ah, the little Craigenside," said Haw-
"No, I do not forget her. We shall talk
her presently."
t's the worst mystery in my young
' groaned Sturgis.
Come, come," said the detective cheer-
'you are not afraid of mystery, I hope.
ything in life propounds a mystery.
, a dark mystery. Woman, a delicious
ery. Without mystery, by heaven,
life would be insupportable."
Really?" muttered Sturgis. The phi-
her in him had been touched.
t would be madness," said Hawley
ly. "Look over your heads. The san-
f the blue sky itself resides in its infin-
which is mysterious. That is why man
olishes the headquarters of the soul
. It's the concrete things we stumble
that drive us mad."
he little detective's eyes blazed like
crystals.
You know what it is to be held in sus-
e by a mystery story," he snapped out,
l you know how you drop back to earth
the solution comes. Of course. In
nature of things the solution is inferior
e mystery itself. The beginning savors
Put it another way. Two and two
four. You know it and I know it;

yes, you will see that the solution of
ery business in hand, for example, will
be in any degree comparable to the
nt mystery, in the hold it has over
mind. I prophesy that it simply won't
ure up at all. It never does. Nothing
petes with mystery itself, least of all
olution."
n that case," said Sturgis, "the bitter
ent for the detective is when he puts
and on the shoulder of the criminal."
he little man laughed.
Just after that," he agreed. "Give him
iful margin of triumph. But wait, have
n this instance even so much as the
lder of a criminal?"
You think then he may have drowned
self?"
My friend, I do not have thoughts in
nce of an occasion for them. I do not
that he drowned himself—no. Before
nsider the criminal I consider the vic-
And before I consider the victim I
t know that there is a victim. Now it
s to me that there is one very simple
od of ascertaining the true quality of
Man or Mechanism: We ought to con-
the theatrical agent who sent you the
'

Dennison?"
Precisely."
he little man drew his watch.
And so I wired him to come at once. If
not mistake that was the whistle of
the train I heard a few minutes back. Mr. Dennison is an old friend of mine, and I think in this instance will humor me. Why, yes, here he comes now."

We were joined by a burly, keen-faced man, dressed in a heavy sack suit and smoking a malodorous cigar.

"In trouble again, I see, John," he said, shaking Hawley by the hand.

"Your testimony may be the beginning of it," said Hawley placidly.

But strangely enough Dennison, on strict questioning, proved to be no better equipped to testify than any member of the audience on that evening. He had booked the act after a very partial exhibition on his private stage. He had seen such acts before—they were always played by living men; and he had assumed that such was the case here. Yet he had to admit that he had had no speech with that scarlet figurine; and at the conclusion of the act Smith had fitted the lid on the box and caused the thing to be conveyed away.

"I thought that was a little strange," said Dennison; "but I was up to my neck in business, and it dropped out of my mind."

"Do you think it possible," Hawley asked, "that a mechanism could be constructed to play such a part?"

"Have a heart, Harry," said his old friend derisively. "I've been in the show business thirty years, and I've never seen one yet."

"Your view is, then, that this was a man, thrown into a trance for the purposes of the act."

"Most assuredly."

"But you offer no proof that it was a man."

"No more than horse sense affords," said Dennison.

He could not say where the man Smith had come from or whether he had had other theatrical connections. This agency appeared to have been the strange man's one point of contact with the world of affairs. Here for an instant his shadowy activities had taken definite shape. He had applied for work, had signed a contract—we saw his signature written in an even, flowing hand; and this had been the last that Dennison had seen of him.

"I kept him making long jumps," he explained. "He was a first-class attraction everywhere."

This was all that Dennison could say, beyond giving the officers the names of the cities and houses at which James Smith had played. One after another we got these houses on the long-distance telephone, but always with the same result. The man Smith had had a whim that not even his associates should know the true inwardness of his act; and his assistant, if indeed a living assistant, had in no case been seen apart from his act. It was general opinion that the unfortunate man must have spent most of his time lying in a trance on the rose-colored cushions of that hideous casket.

Hawley then ordered the sea to be dragged at low tide at the place where Sturgis and I had overtaken the Fra Diavolo. It was always possible that Mr. James Smith had drowned himself; but certain massive doubts of the correctness of this position persisted. If he had drowned himself why, for one thing, had he taken the trouble to sink his betraying manikin with a weight attached to it? A man hunted to his death would not naturally be thinking of such mystifying trifles. Why, if he meant to make away with himself, should he care what evidences of his crime he left behind him? He certainly could not expect to be tried in another world on the evidence which men might produce in this. Again, if he had drowned himself at the spot where we had found the Fra Diavolo the tide, which then was horsing in, would almost certainly have cast him up. Yet we waited in vain for him or any part of him.

"No, no," said Hawley; "the chances are that he hid among the dunes and has since made his escape. There may be something to be picked up across the river, however, even now. Let us repair to the Place of Pirates."

The girl received us on the porch, where introductions were made.

"There are a few questions," said Hawley smoothly, "which I should like to put to you, Miss Craigenside, with regard to the odd disappearance of a—mechanism from the theater dressing room at Silver Glade."

"Why should you come to me?" said the girl almost sullenly.

Hawley raised his brows.

"We must come to all whose testimony might have a bearing on the case," he said.

How I Raised My Earnings from $30 to $1000 a week

The Story of a Young Man's Remarkable Rise, as Told by Himself.

THREE years ago I was earning $30 per week. With a wife and two children to support it was a constant struggle to make both ends meet. We saved very little, and that only by sacrificing things we really needed. Today my earnings average a thousand dollars weekly. I own two automobiles. My children go to private schools. I have just purchased, for cash, a $25,000 home. I go hunting, fishing, motoring, traveling, whenever I care to, and I do less work than ever before.

What I have done, anyone can do—for I am only an average man. I have never gone to college, my education is limited, and I am not "brilliant" by any means. I personally know at least a hundred men who are better business men than I, who are better educated, who are better informed on hundreds of subjects, and who have much better ideas than I ever had. Yet not one of them approaches my earnings. I mention this merely to show that earning capacity is not governed by the extent of a man's education and to convince my readers that there is only *one* reason for my success—a reason I will give herein.

One day, a few years ago, I began to "take stock" of myself. I found that, like most other men, I had energy, ambition, determination. Yet in spite of these assets, for some reason or other I drifted along without getting anywhere. My lack of education bothered me, and I had thought seriously of making further sacrifices in order to better equip myself to earn more. Then I read somewhere that but few *millionaires* ever went to college. Edison, Rockefeller, Hill, Schwab, Carnegie—not one of them had any more schooling than I had.

One day something happened that woke me up to what was wrong with me. It was necessary for me to make a decision on a matter which was of no great consequence. I knew in my heart what was the right thing to do, but something held me back. I said one thing, then another; I decided one way, then another. I couldn't for the life of me make the decision I knew was right.

I lay awake most of that night thinking about the matter—not because it was of any great importance in itself, but because I was beginning to discover myself. Along towards dawn I resolved to try an experiment. I decided to cultivate my will power, believing that if I did this I would not hesitate about making decisions—that when I had an idea I would have sufficient confidence in myself to put it "over"—that I would not be "afraid" of myself or of things or of others. I felt that if I could smash my ideas across I would soon make my presence felt. I knew that heretofore I had always begged for success—had always stood, hat in hand, depending on others to "give" me the things I desired. In short, I was controlled by the will of others. Henceforth, I determined to have a strong will of my own—*to demand and command what I wanted.*

But how shall I begin? What shall I do first? It was easy enough for me to determine to do things—I had "determined" many times before. But this was a question of will power, and I made up my mind that the first step was to muster up enough of my own will power to stick to and carry out my determination.

With this new purpose in mind I applied myself to finding out something more about will power. I was sure that other men must have studied the subject, and the results of their experience would doubtless be of great value to me in understanding the workings of my own will. So, with a directness of purpose that I had scarcely known before, I began my search.

The results at first were discouraging. While a good deal had been written about the memory and other faculties of the brain, I could find nothing that offered any help to me in acquiring the new power that I had hoped might be possible.

But a little later in my investigation I encountered the works of Prof. Frank Channing Haddock. To my amazement and delight I discovered that this eminent scientist, whose name ranks with James, Bergson and Royce, had just completed the most thorough and constructive study of will power ever made. I was astonished to read his statement, "The will is just as susceptible of development as the muscles of the body"! My question was answered! Eagerly I read further—how Dr. Haddock had devoted twenty years to this study—how he had so completely mastered it that he was actually able to set down the very exercises by which anyone could develop the will, making it a bigger, stronger force each day, simply through an easy, progressive course of Training.

It is almost needless to say that I at once began to practice the exercises formulated by Dr. Haddock. And I need not recount the extraordinary results that I obtained almost from the first day. I have already indicated the success that my developed power of will has made for me.

But it may be thought that my case is exceptional. Let me again assure you that I am but an average man, with no super-developed powers, save that of my will. And to further prove my contention let me cite one or two instances I have since come across, which seem to show conclusively that an indomitable will can be developed by anyone.

One case that comes to my mind is that of a young man who worked in a big factory. He was bright and willing, but seemed to get nowhere. Finally he took up the study of will training, at the suggestion of Mr. W. M. Taylor, the famous efficiency expert of the Willys-Overland Company, and in less than a year his salary was increased 800%. Then there is the case of C. D. Van Vechten, General Agent of the Northwestern Life Insurance Company, Cedar Rapids, Iowa. Just a short time after receiving the methods in will development suggested by Prof. Haddock, he felt that they would be worth from $3,000 to $30,000 to him.

Another man, Mr. H. D. Ferguson, residing in Hot Springs, Ark., increased his earnings from $40 a week to $90 a week in a remarkably short space of time after he began the study of will training. These are but a few—there are many other equally amazing examples which I personally know about. And aside from the financial gain, this training has enabled thousands to overcome drink and other vices almost overnight—has helped overcome sickness and nervousness, has transformed unhappy, envious, discontented people into dominating personalities filled with the joy of living.

Prof. Haddock's lessons, rules and exercises in will training have recently been compiled and published in book form by the Pelton Publishing Co., of Meriden, Conn. Mr. Pelton has authorized me to say that any reader who cares to examine the book may do so without sending any money in advance. In other words, if after a week's reading you do not feel that this book is worth $3, the sum asked, return it and you will owe nothing. When you receive your copy for examination I suggest that you first read the articles on: the law of great thinking; how to develop analytical power; how to perfectly concentrate on any subject; how to guard against errors in thought; how to drive from the mind unwelcome thoughts; how to develop fearlessness; how to use the mind in sickness; how to acquire a dominating personality.

Some few doubters will scoff at the idea of will power being the fountainhead of wealth, position and everything we are striving for, and some may say that no mere book can teach the development of the will. But the great mass of intelligent men and women will at least investigate for themselves by sending for the book at the publisher's risk. I am sure that any book that has done for me—and for thousands of others—what "Power of Will" has done—is well worth investigating. It is interesting to note that among the 150,000 owners who have read, used and praised "Power of Will," are such prominent men as Supreme Court Justice Parker; Wu Ting Fang, Ex-U. S. Chinese Ambassador; Lieut.-Gov. McKelvie of Nebraska; Assistant Postmaster-General Britt; General Manager Christeson, of Wells-Fargo Express Co.; E. St. Elmo Lewis; Governor Arthur Capper of Kansas, and thousands of others.

As a first step in will training, I would suggest immediate action in this matter before you. It is not even necessary to write a letter. Use the form below, if you prefer, addressing it to the Pelton Publishing Company, 17-B Wilcox Block, Meriden, Conn., and the book will come by return mail. This one act may mean the turning point of your life, as it has meant to me and to so many others.

PELTON PUBLISHING COMPANY,
17-B Wilcox Block, Meriden, Conn.

I will examine a copy of "Power of Will" at your risk. I agree to remit $3 or remail the book in 5 days.

"I am afraid I can tell you nothing," replied the girl.

Nevertheless, she groped for a chair back and tilted it against her body. In the intervals of talk I heard the heavy tread of Captain Craigenside within. He seemed to be pacing up and down.

"I am sure you will see," continued Hawley gently, "that complete candor now may save us all a world of embarrassment later."

Jane Craigenside looked up at the gulls which were wheeling over the house.

"Put your questions," she said wearily.

"In the first place, then, had you any object beyond mere amusement in going to the Glade on the night of July seventeenth?"

"None at all."

"You had no suspicion, no forewarning, that the thing to be exhibited in the guise of Man or Mechanism was other than it seemed?"

"None whatever."

"You had no acquaintance with the operator, Mr. James Smith?"

"I had not."

"Then will you kindly explain to us the meaning of your assertion, made in the hearing of a dozen people, that it was a living man—and that after the disappearance? You remember crying out 'Let the river be searched'?"

Jane Craigenside nodded; her lips moved. Suddenly she seemed to gain courage.

"I was mistaken," she said calmly. "The features of the puppet were very like those of one I had known in the Orient; it seemed to me that some monstrous trick was being played. Then when I saw the thing close up I knew I was mistaken."

"Yet you had fancied a resemblance?"

"Yes."

"A strong resemblance?"

She nodded again.

"So strong," continued Hawley, "that you all but fainted, and had to be assisted out of the theater by Mr. Weymouth, I understand."

"Is that so much to be wondered at?" he cried piteously. "I am all unstrung; the sickness of our old housekeeper has prevented me from getting sleep."

"Of course," said Hawley sympathetically. "I do not wish to press you too far. A last question: Was this person whom you fancied the manikin resembled an intimate friend or a mere casual acquaintance?"

"A mere acquaintance," said the girl.

"What profession or trade had he?"

"He was second mate aboard my uncle's ship."

"Ah, the Asphodel!"

The little man's eyes glowed and crept round to the ship lying in the river:

"He was second mate. And where did you last see him?"

"In Nagasaki."

"He left the ship?"

"Yes."

"Of his own accord?"

"Yes."

"Was there any unusual reason for his going?"

"No, he merely tired of the ship, as sailors will."

Hawley stared at her intently, and she dropped her eyes. Her last answers had been barely audible. It seemed to me that her least movement, her slightest word, were like parts of a subtly organized defense of the House of Craigenside.

Hawley stood up, clapped his hands sharply behind his back, and began to pace back and forth along the porch, as if considering. Then he put out a white hand and stroked the head of the nearest dragon.

"The old lady who is sick," he began again—"she has been long a member of your household?"

"Longer than I have myself," returned the girl with a faint smile. "But you must not question her," she went on with a serious intentness. "You must not really. Her condition is so bad that the doctor fears he may go with any tide."

"Ah, yes, with the tide," said Hawley. "A very poetical notion. Poor lady, her testimony might be valuable, but we will not force ourselves upon her."

He had been looking about him, and now he rubbed his hands together briskly.

"This is a noble old house," he said, as if his questioning were over. "These ferocious animals make a good guard for it. They were brought from the East?"

"Yes."

He moved toward the door, inspected the brass mermaid there, and turned as if to go. But then the clock inside struck four, and he wheeled about.

"A grandfather's clock!" he exclaimed with a note of genuine pleasure, as it seemed. "Well, well, I am repaid for my visit surely. I have made them a subject of special investigation."

The door behind him creaked and Ruel Craigenside stood on the threshold of the great double parlors.

Hawley put out his hand.

"Captain Craigenside, I believe? I am just examining your clock. It is a curious specimen, sir. The head is common enough; the tin ship is rather oftener met with than the background of the sky with a moon rising in it, perhaps. But the case—I think it is the oddest case I ever saw. Bless me, it has every appearance of ——"

"Time and Eternity," muttered Craigenside in his beard.

"Exactly," said the little man; and with an unforeseen gesture he snatched open the lid of the clock. The interior of the case was empty. The vertical slats had been ripped away, and no trace of the god remained behind the tarnished pendulum.

"Yes, gone, as you see," said Craigenside.

"Gone?" said Hawley pleasantly. "What is gone?"

"You well know, or you wouldn't have opened the clock. The jade is gone."

"Was it there yesterday?" continued the little man, whose inquisitiveness seemed to flow out and fill every crack and cranny of suspicion like a fluid.

Without answering, Captain Craigenside lumbered through the doorway and began walking toward the dunes.

"You must excuse him," said Jane Craigenside. "He's not himself at all. This was an heirloom, a little figure that he prized very highly. I can't understand who can have taken it."

"Suppose we say," said Hawley amiably, "that Eternity has taken leave of Time. Don't you think, my dear girl, that it would be as well to make a clean breast of the whole matter?"

"I will say nothing more," cried the girl.

"As you please," said Hawley. "We will come at it another way."

As we crossed the river I said glibly: "If mystery is what you crave you should be satisfied with this."

The little man said absently:

"*Finis coronat opus.* We shall see. We shall see. And now, my dear boys, one further question in regard to the bag which our friend the ornithologist made use of—or rather to the lens of his camera: Did you note closely the character of the flashes you have described?"

"Their character?"

"Yes. You have described them as intermittent. Now, did they intermit regularly or irregularly? In your judgment, was some intelligible communication being made to the man on the housetop?"

"I should say not. The flashes were regular. Furthermore, in my opinion the brain of Craigenside during those few moments was in no condition to remark an intelligent sign. His face was emptied of all expression, the eye fixed, the jaw slack."

"In one word—tranced?"

"If that were possible."

The little man fell back against the tiller of the boat we were rowing.

***Sold at Actual Cost*—This Big, Convenient Orange Juice Extractor**

Illustrated Above—8 Inches from Handle to Spout

Ten cents at retail stores or 16c direct by mail east of the Missouri River—15c at stores west of the Missouri and in Canada or 24c direct by mail. We make this offer to those who use Sunkist Oranges merely to make it easier for them to serve the juice of this luscious, healthful fruit.

"Drink an Orange"

If the liver is sluggish or you feel "out of tune," drink an orange or two daily. Try it ten days, for better digestion. The results are almost certain if this practice is made a habit.

These *natural* ways to insure health are being advised by physicians more and more every day. Organic salts and acids in rare combination are present in California oranges. And the best of it is that nature has made this beneficial treatment alluring by delicious flavor.

Sunkist

Uniformly Good Oranges

Sunkist Oranges are luscious, tender and heavy with glistening juice. And this pure juice, with nothing added, is deliciously refreshing, as a year-'round early morning, afternoon or evening drink. In combination with ginger ale, carbonated waters and sugar, you have almost endless variety.

Send now for an extractor. Get your recipe book. Learn the many other ways to use this healthful fruit.

The Customary Two Weeks

By FREEMAN TILDEN

ILLUSTRATED BY F. R. GRUGER

"George! I Know You Don't Mean What You Say. But We Must Go—at Once!"

IT WAS Vibert's boast that when it came to firing an employee he never shirked, sparred or minced the ultimatum. Therein Carl Vibert differed from most managers; for one thing to your pencil in and figure y percentages st the poor who isn't g good, and another thing ll that same devil in and e blue badge edom to his Such a job away the ge man's ap- and gives him e-aged nerves. body has to do e sure. Like- somebody has n the switch connects with ectric chair; u don't notice shing or shov- standing in r the position. t Vibert liked d whether he ted it or not, ld have been nough. Some- triumphant ven malicious itself on his hen he fired a It was as he was en- a superior- ublishing it; making his felt. And, than all, he passed the gn with a kind r.

e office of the Eclipse Tool Company was in the north end of the factory. It was a sion, on two floors, of little boxes, built when wood partitions were cheap and y dreamed of opening up a whole floor and letting the manager have a look. On ver floor, east, was the office of the president, Harry Burnhart. The president's was locked whenever golfing was good; and for a man who has the carfare there v days in the year when golfing isn't good somewhere in the United States. ly overhead was Vibert's office. Somebody called it the "dark room," and the stuck.

e dark room it was, though it had four windows. It had in it the shadow of —the hatred, unspoken but as living as the radio, of the office force for the er. It had Vibert's own dark, suspicious eyes, and over them Vibert's heavy eyebrows and hair. He usually wore dark clothes.

ere was one bright spot in the room. It was the gleam of a lamp in a cellar. She sat y facing Vibert, and her gorgeous hair, shading to a gold that you sometimes see at and her bright, witty eyes fought the somber shadows across the desk—and It was only truly the dark room when Muriel Clemm was away.

vas the best stenographic job in the office, so she had been glad to get it, in spite ert's personality. To do him justice, he evidently tried to be wholly decent to But Extell, the advertising manager, who worked in the adjoining room, suspected deep motives, and was in a jealous rage half the time.

ated, as the Eclipse people were, in a town where the factory was practically the town life, it was almost pathetic to observe the isolation of Carl Vibert. As he back and forth from his boarding place to the factory four times a day, the office force passed him with scarcely a nod of recognition. Some of the younger girls deliberately crossed the street when they saw him coming. In the office they were bound to be respectful; outside they felt they could do as they pleased.

Now all this is on the minus side of Vibert. A man doesn't hold a job, under any régime, on the minus side. There must have been something plus—and there was. When Vibert fired a man he had two justifications. One was that he was acting, as he saw it, in the best interests of the firm. There wasn't a question of his sincerity on this point. The other was, as he once loosened up and said, that when the time came for him to get his own medicine he wanted it handed to him in exactly the same manner. He may have been equally sincere about this. Still it was rather an easy thing for him to say, after all. He felt secure, with a lot of years ahead of him. Just as you sometimes hear lusty gentlemen talking about the advantages of euthanasia for the unfit.

But Vibert was a plugger. He was a glutton for work. You could see a light in that corner upstairs office when the Montreal sleeper roared across the bridge just under the windows, about half past ten at night. He had that patient, persistent kind of mediocrity that had made a deep impression on Harry Burnhart, soon after Old Man Burnhart died and the youngster took charge. He knew how to dictate a straightforward, minutely detailed letter to Harry Burnhart, that the latter, reading on the veranda of a Palm Beach hotel, construed almost as a personal compliment. He was a driver, with the defect of a driver—that when he let the reins go loose for an instant the horses slowed up. He was a martinet, with the defect of a martinet—that he got the hand without the spirit. He had a great head for details, with the defect that goes with this merit—that when you look for little things you often miss the big. He was the sort of man that could pick out Keokuk on the map of Iowa at a glance—and never see the big IOWA that stretched across the state.

Unloved, then, was Vibert; but nobody hated him quite so bitterly as George Extell. Had there been no other reason, this would have been enough: Muriel Clemm was Vibert's stenographer, and George Extell was in love with Muriel Clemm.

"Pop" Grinnell was the oldest old employee. He must have been in the game from the day Old Man Burnhart started making tools in a room over the wheelwright's—of ancient memory. He started as a woodworker, became a correspondent, and remained one. The old man would have cut off his right hand, on principle, before he would have ever let Pop go. He ought to have left Pop a few thousand when he died; but he forgot that. Young Harry ought to have pensioned Pop when he took hold; but he didn't. And so Pop was left to the mercies of Vibert, who had no sentimental interest in him, and watched the old fellow's honest efforts with a hawklike eye.

office with a look of mingled fear and joy on his face. He brought with him the little bundle of personal effects which he had taken away, and started in with his patient, slow, and not absolutely sure instruction to travelers.

Extell, coming back from lunch ten minutes late, saw Pop in his room, waved his hand at him meaningly, and went to his own desk to gloat. He had not been indulging in that pastime long before Vibert entered. Extell's heart beat fast as he saw the manager. He felt sure that he had come to talk about Pop Grinnell.

He would give him as good as he sent!

But Vibert said nothing about Pop. Instead, he pulled up a chair, favored Extell with a ghost of a smile that made the young fellow's spine cool, and began blandly:

"About that catalogue, Extell? You know we want to use it this year."

"It isn't my fault, Mr. Vibert, if the engravers can't get out the half tones on time," began Extell with a manner that his excitement rather than his intent made unfortunate.

"I take it the engravers aren't running this office," replied Vibert. "However, I don't want to be unjust to you—of course delays are bound to happen. By the way, Extell, you don't call that a very snappy ad, do you?" The manager thrust an advertisement, clipped from a trade journal, on the desk in front of the advertising manager.

Extell did not reply. He gazed at his work wonderingly.

"That ad," went on Vibert, "from my point of view has about as much life as a mummy. It hasn't as much punch as a Sunday-school program. And I'll tell you why, Extell. I'll tell you why your ads don't pull. It's because you don't understand selling. You want to write something pretty. I don't say you couldn't write swell poetry, Extell. I s'pose you know more about grammar than the rest of the office put together. But I've had travelers, Extell, that can hardly write their name, ignorant as horse jockeys, that could put over an ad—dictate it—that would sell something. Now we're not doing the advertising we should. I've worn out my voice trying to get Mr. Burnhart to see that we ought to give our men on the road some backing. He doesn't see it yet—but he will. But the stuff you turn out, Extell, wouldn't sell peanuts to the bleachers."

Extell, crimson, did not reply. He wondered how he was able to restrain himself from choking this malefactor. After a moment's pause, to let the words sink in, Vibert rose and stood at the door. Then he added:

"Another thing, Extell. I wish you would get round to the office the same hours as the rest of us. Look at your card for this half month. It looks like the social visits of a banker. It won't do, Extell. Think it over."

When Vibert had gone out Extell sat stunned. He felt as though he had been deftly relieved of all his vital organs; in the pit of his torso there was a gnawing void. Nobody had ever talked to him like this before. True, Vibert had mentioned the matter of Extell's being late once or twice, but not in a way to carry conviction to a young man who had been more or less the petted child of the office.

Extell had gone directly from high school into the employ of the Eclipse people. His father had been a friend of Old Man Burnhart, and his way had been made comparatively easy. And, inasmuch as John Burnhart, founder of the business, had held the old-fashioned view of advertising—that it was a sort of necessary evil—Extell had had no criticism worth the name.

The young fellow had considered his advertisements exceedingly fine. He used hackneyed catch phrases with a naïve belief that the waiting world would find them seductive. He had begun by toiling ardently over his copy, but during the past two years he had been loafing, partly without knowing it. It wasn't entirely his fault—the office simply hadn't taken the job of advertising manager seriously.

As to being late at the office, he had to admit the validity of that charge. But he had come to endow himself with a sort of artistic temperament—he felt a little beyond the rules.

If it had been truly an awakening—if Extell could have seen that Vibert, no matter what his underlying animus, was really telling the simple truth—the young fellow might

went down to the hotel and played bid whist savagely, reaming that a certain pretty and much-desired girl ocking back and forth in her room and sobbing im-tly, sobbing partly for a reason unknown, and because she loved a young man who chose to ride oboggan.

at night Extell met a crew of good fellows at the hotel, were going up-river in a launch in the moonlight. He along and got to bed at quarter to four in the morning. d the fervent notion, as he took off his clothes, that uld just take a nap and be at the office at eight sharp.

He woke up at eleven, fell asleep again, and woke up again at half past twelve. By going without his luncheon he was at the office at one.

Extell's interior telephone rang. Vibert would like to see him. He went to the corner room with a combination of misgivings and defiance.

The office manager was brief. And he accompanied what he said by that peculiar half-sneer that had made him a hated man. He said:

"Extell, you were probably sick this morning?"

The young fellow didn't choose to lie. He replied that he was not sick; but he advanced no reason for his absence.

"A sort of sleeping sickness," went on Vibert ironically. "I haven't been hasty with you, Extell. Some ways you're a likable chap. But I won't keep an incompetent and I won't keep a drone. You can have the customary two weeks. That's all."

The Young Fellow Looked Into the Clear Eyes, Hesitated, and Then Went Into His Own Room

Extell looked at the manager with wild incredulity. The customary two weeks! Those words—to him! Without explanation! Without preamble! The stern stuff of self-respect that was in him told Extell to supply a smile, say "Very well, sir," and quit the office. But he weakened again and justified Vibert's sneer to some extent as he said with feeble defiance:

"We'll see about that, Mr. Vibert!"

Vibert went on writing without replying. He knew the strength that lay in silence, if Extell didn't.

Before he had reached his own room Extell had made up his mind just what to do. But he stopped in the hall, just in front of his door, as Muriel Clemm came along toward him with her hands full of letters. She saw his white face and guessed unerringly. Her breath came fast as she whispered "What is it, George?"

Extell gulped as he replied with an assumed airiness:

"Oh, Vibert thinks he's fired me. He thinks so. He thought he fired Pop Grinnell; but it turned out he hadn't. Next thing he knows he'll fire himself."

The silken eyelashes closed over the wistful eyes, and opened wet. She shook her head, not trusting to words, and started along. But she turned and whispered:

"It's the best thing that could happen. You will win, George."

He thought she meant that he would be able to defeat Vibert's purpose, and it gave him confidence. If he had known what she really meant, he would have collapsed.

Extell found that Harry Burnhart was leaving for French Lick at five o'clock. He went up to the house as soon as he could pull himself together. The president of the Eclipse was obviously surprised to have the same visitor again so soon; but he greeted Extell just as cordially, and at once said:

"Oh, that's all right about Pop Grinnell, Extell. I saw Mr. Vibert, and Pop is reinstated. Didn't you know it?"

Extell went scarlet. Somehow the platform fell from under his feet when Harry Burnhart assumed that he came again philanthropically. But he had to say something now. He stammered:

"It wasn't about Pop I came this time, Mr. Burnhart. I—I have been unjustly discharged by Mr. Vibert. He has never liked me, and since I came to you about Pop Grinnell ——"

Harry Burnhart's lips came together with a different expression. He regarded Extell in a not unfriendly way, something of pity and a little of contempt in his glance. But he shook his head and replied:

"I'm sorry, Extell; but you've created a bad situation. I don't mean I blame you, because I don't know the facts; but I mean that you've somehow managed to raise an issue between Mr. Vibert and yourself. Now in such a case as this one or the other always goes. I don't want to let Mr. Vibert go. I hire him to run the business. In Pop Grinnell's case—well, that was almost a family affair. I say, Extell, you're young! Jump out and show Mr. Vibert that he made a mistake—eh? Nobody dependent on you, is there? Well, well, Extell, hit the trail for the West and make good. This town's half asleep anyway. If I can be of any assistance, let me know. I'll give you a good recommendation—but recommendations are no good. Good-by and good luck!"

Extell found himself halfway to his room before he wholly came to his senses.

"The dirty crowd!" he kept repeating to himself. "The dirty crowd!" What galled him most was that Vibert had beaten him. It was evident that the manager had apprised Harry Burnhart of his intention. At half past five he went down to the office, bundled up a few things of his own, rolled up his linen duster and jammed it into his pocket, and left the place without telling anyone that he was through. It gave him a measurable satisfaction to believe, as he passed Pop Grinnell's door, that he was martyred to save Pop. He couldn't help wondering if Pop appreciated it.

The next day was Saturday. Extell had to go to the office to draw the customary two weeks' salary to which he was entitled by Vibert's sardonic custom. It was a perfect day. Extell and Muriel Clemm had planned, the previous week, to go canoeing up-river in the young fellow's canoe. They were both skillful paddlers, and this was one of their most joyous diversions on the Saturday half-holidays.

The excursion proved to be only the skeleton of a pleasure that was. After a period of straining to speak of other things than this biggest thing, they both broke down and faced the necessary. Halfway to their destination Extell steered in toward the bank, and they pulled the canoe up under a canopy of hemlocks that grew down to the water's edge. Then they sat down on the brown carpet. She spoke first.

"Tell me," she said, looking at Extell anxiously, "what you are going to do."

"Oh, I'll find another place easy enough," he replied.

Reflectively the girl lifted the folds of her blue-dotted skirt and smoothed them all out. She was looking down at the ground now. Finally she went on:

"If I didn't know that you would do something worth while, George, of course I couldn't care for you as I do. I'm glad you are out of this—this office. I keep my eyes open, George, and I can see that the Eclipse isn't making a bit of progress. I wouldn't tell that to anyone else in the world, and you mustn't say a word. But since John Burnhart died everything has been going backward. You'll say it's Mr. Vibert's fault. I don't know—but I don't think it

The bonus may be only thirty per cent. But the employee knows he is going to get a very tidy Christmas present, its size depending on the year's profits.

Handing the bonus money over in a lump at the end of the year is a better encouragement to thrift and saving than apportioning it out monthly or weekly during the year.

Working conditions are probably as agreeable as any conditions that involve clerical toil can be. This sanctum of high finance, a biscuit's toss from the feverish Stock Exchange, with Broad Street surging and shouting on one side and Wall Street swarming and sweating on the other, is as quiet as a village store on a rainy Monday morning. Going through the glass doored vestibule, you run plump into two very tall and brawny gentlemen in everyday clothes, your first step inside bringing you figuratively right into their arms. They are very courteous, smiling in the most affable manner as they inquire whom you wish to see, take your card, and show you to a seat—the seat being directly under their amiable eyes.

Nothing could be more polite. All the same, you perceive they are there to discourage any mere wandering about. As a matter of fact, there is little coming and going; no confusion; you may listen many minutes and hardly hear a sound. It impresses you as being a snug, undistracted sort of place in which to work. And the house, in fact, takes very good care of its men.

But it goes outside for partners. Running over the list shows where they come from and indicates how. Two years before Mr. Stettinius was made a partner, Dwight W. Morrow was admitted to the firm. He was born in a Pennsylvania town, his father being a school principal. He went to Amherst; then through the Columbia Law School; and was engaged by a big New York law firm that did a good deal of business for Morgan & Company. At forty-one he was made a partner in this law firm.

The 1911 Crop of Partners

FOR some years Charles Steele has been the lawyer member of the Morgan house. Of late he has not been so active as formerly, and the law business has grown along with other branches. So in July, 1914, Mr. Morrow—already for some years member of a law firm that did much business for the house—was made a Morgan partner, going in rather as a lawyer than as a banker.

In 1911 three members were taken in—Thomas W. Lamont, William H. Porter and Horatio G. Lloyd. Mr. Lamont was born in a New York village, went to Phillips Exeter and to Harvard, struck into the banking business in New York City, and advanced rapidly. He was made a Morgan partner at forty-one and had been a man of weight in the financial district for several years before that. Mr. Porter was born in a small town in Vermont; went through high school and to an academy. His first employment in New York was in the office of a small railroad; then he went into the Fifth Avenue Bank, as a clerk, at the age of eighteen. Seven years later he went to the Chase National in a much more responsible position, and at thirty-eight was made a vice president of that big bank. Mr. Lloyd came from Philadelphia. While working there as a clerk he studied law in the University of Pennsylvania and was admitted to the bar. He was a clerk in a trust company, and after a while was made secretary of the company. A new trust company was organized. He was elected treasurer, then vice president, then president of it; and so progressed into partnership in Drexel & Company, which is the Philadelphia connection of Morgan & Company.

In 1909 Henry P. Davison was made a Morgan partner. He was born in Troy, Pennsylvania, and went to a preparatory school, but not to college. He taught school at

oung man a certain weight and force which
f upon the people he came in contact with,
ordiality that made friends readily and kept
ick Mr. Gage as a person having the knack
men.
iccessful men of affairs instinctively know
l—the sort of well-oiled, aggressive ability
its way among men with the maximum of
inimum of friction. Some time before this
Chicago's weightiest captains of industry
sion to the South. So much of the city's commercial leadership could not be permitted to go off on a special train by itself. The press must have a representative along, and the young man on the Tribune was at once chosen for the post. Any company of successful business men, having to choose one among the reporters known to its members, would quite certainly have picked him.

As private secretary to the Secretary of the Treasury, Mr. Vanderlip so well satisfied his chief that in a year or so Mr. Gage had him appointed an Assistant Secretary of the Treasury. The Treasury Department always has more or less dealings with Wall Street, as the center of the country's banking system; so the new assistant secretary began making acquaintances among bankers there. James Stillman, president of the National City Bank, was one of those whose acquaintance he made, and the qualities that had recommended him to Mr. Gage also recommended him to Mr. Stillman, who presently invited him to become a vice president of the bank.

Again, it was not because Mr. Vanderlip knew anything about the banking business in detail, for he had never been behind a bank counter in his life—except possibly as a visitor. It was not primarily because he understood the theory of banking and the principles of finance. In the economic departments of our colleges Mr. Stillman might easily have found fifty men who could talk circles all round Mr. Vanderlip on the theory of banking and the principles of finance—and it is safe to say the president of the City Bank would have been aghast at the suggestion of appointing any of those men a vice president of his institution.

It was because he liked this Assistant Secretary of the Treasury personally, and saw in him the sort of genial, forceful ability that attracts men, makes friends, impresses itself. He judged that Mr. Vanderlip would be a useful instrument in extending the reach and influence of the National City Bank; not because of his exact, technical knowledge of banking—much less because of his money, for, as he had been employed all his life at a modest salary, first as newspaper reporter, then as private secretary and assistant secretary, there can be no disparagement in guessing that he had none to speak of—but because of his personal qualities.

Frank A. Vanderlip

Henry P. Davison

In fact Mr. Vanderlip himself has confessed that when he went into the bank as a vice president he found to his surprise that there was nothing in particular for him to do.

He had a fine job at a fine salary, and his only definitely appointed duty consisted in drawing the salary. Evidently it was just a personal equation that Mr. Stillman had wanted in getting him into the bank. In order to get himself anything in particular to do the new vice president had to strike out on his own motion and organize a bond department.

For some time before Mr. Stillman retired from the presidency it was a foregone conclusion and an open secret that Mr. Vanderlip would succeed him. Now, as chief mover in the City Bank, the City Company, the fifty-million-dollar American International Corporation, and other enterprises, he is picking out young men for seats up near the front, in the same way that Mr. Gage and Mr. Stillman picked him.

There are thirteen vice presidents of the City Bank, most of whom Mr. Vanderlip has selected—four from the Middle West, a couple from the Southwest, and so on. He picked them because he liked them personally and found in them certain forceful, genial personal qualities that are easy enough to recognize but hard to describe. Whether they knew anything in particular about banking was a secondary consideration, and whether they had any money to speak of was no consideration at all.

Next in size after the City Bank comes the Guaranty Trust Company, with half a billion dollars of assets. Its president, Charles H. Sabin, was born in a town in the Berkshire Hills and went to school there, but not to college. At seventeen he went to work with a concern that dealt in flour, but two years later started in banking, as a clerk, in Albany, New York. Two years more and he was promoted to the teller's cage, and at thirty was elected cashier. A few years later he moved up to a vice presidency. The next step was to the vice presidency of a comparatively small bank in New York City; but he kept on going.

Thomas W. Lamont

James S. Alexander, president of the National Bank of Commerce, which counts for about three hundred and fifty million dollars, was born at Tarrytown, New York, and began his business career at eighteen as a clerk in the bank there. Two years later he went down to the city as a clerk in the big bank of which he is now president. It was not until he was thirty-four that he won his first official position—an assistant cashiership. Since then he has moved up steadily to the top.

This, it will be noticed, is about the traditional case of the young man who starts at the bottom of the ladder and works his way up step by step until he arrives at the topmost rung of the identical ladder on which he began.

Great Men's Orbits

A SOMEWHAT similar case is that of James N. Wallace, president of the Central Trust Company. He was born in a Connecticut village and went to work at the age of fifteen in a private banking house of which F. P. Olcott was a member. Mr. Olcott, an eminently successful and finally very rich banker, took a liking to the lad and, when he was made president of the Central Trust Company, carried young Wallace along with him as a sort of personal office boy. Mr. Olcott's liking continued and the youth had the stuff of success in him; so at the age of thirty-nine, Mr. Olcott retiring, Mr. Wallace was made president of the big concern.

But these traditional cases are exceptional. In most cases there is considerable skipping about from one ladder to another. There is Seward Prosser, president of the Bankers Trust Company, a creation largely of the late J. P. Morgan. He was born in Buffalo; but his parents moved to Brooklyn, where he attended public school. He went to work for a life-insurance company and after a while formed a partnership for the purpose of writing life insurance. He made acquaintances among influential men, who thought highly of his capacity; and at the age of thirty-six he was elected a vice president of the Astor Trust Company. A few years later he was made president of the Liberty National Bank, and from that went to the Bankers Trust.

The Morgan influence is powerful in the Bankers Trust Company; in fact, it is usually called a Morgan concern. It may be noted that Mr. Cochran, the new Morgan partner, graduated into his present position by way of the Astor Trust Company and the Liberty National Bank; and that Mr. Lamont, another Morgan partner, also came from the Liberty National Bank. Neither the Astor Trust nor the Liberty Bank is among the bigger financial institutions, but the cases of Messrs. Prosser, Cochran and Lamont suggest how the lines of promotion run. It is primarily a question of making the right impression upon a man who has high financial positions to dispose of, which means that you must somehow get into the great man's orbit. If you are so fortunate as to be in an institution that is in his orbit your chance of advancement to high command is that much better.

To illustrate another point we may take two more big bank chiefs. First, Gates W. McGarrah, president of the Mechanics and Metals National Bank, whose assets foot up a quarter of a billion dollars. He was born in a small

"Say, this ain't the sort of tip you think it is!" he said sharply. "I got it straight from the inside, I say."

"Sure!" nodded Mr. Pincus genially. "That's where they all come from—the inside. Blake, when he gets cleaned out last year, he gets a tip from the inside, too, I guess."

"Blake? What's Blake got to do with it?" demanded Mr. Thurlow bewilderedly; and Mr. Pincus grinned.

"It's a secret—nothing! Only all of us gets cleaned out some time; and mostly it's off a tip. I get cleaned out—well, maybe; and you get cleaned out—yes; for sure. Then we hunts up a job; or, if we don't get it, some two-spot of a crab has a chance to call us a loafer or a street bum. Sure; for a tip, yes!" said Mr. Pincus.

"Say, what're you driving at?" demanded Mr. Thurlow darkly; and, again sucking his teeth, Mr. Pincus once more idly smiled.

"I was saying it was a fine weather for ducks—some ducks," he replied; and, abruptly turning on his heel, Mr. Pincus left Mr. Thurlow snorting indignantly, and hurried toward the cashier's cage at the rear.

Beeks, a round-faced, pudgy personage, the office manager, was standing there, laughing and joking with the cashier; and, his air insinuating, Mr. Pincus nudged him on the arm.

"Say, Handsome," said Mr. Pincus, "what's this that feller Blake now asks Rooker to stake him for? A hunnerd shares of something, was it?"

Beeks nodded indifferently.

"That bum? Oh, sure! It was a hunnerd shares, first; but before Rooker threw him out it was a meal ticket and the price of a room he was begging."

Mr. Pincus gave a start.

"Vat? He don't eat, and he sleeps in a park, maybe?"

It was so for all Beeks knew—all Beeks cared, either, one had thought. Rooker, Burke & Co.'s was not a tramps' lodging house; besides, Rooker was tired—sick and tired of supporting panhandlers like Blake. Enlarging on his topic, the subject of his employer's open-handed liberality, Beeks was telling how, only the Saturday before, they'd slipped Blake a couple of bones; and here the hobo was back for more—when all at once Beeks woke to the fact that he was addressing empty air. Mr. Pincus had departed.

Of a sudden that air of his, that show of easy, idle indifference, had seemed to vanish; and, with a muttered exclamation—"*Himmel!*"—that and an agitated grunt, Mr. Pincus had darted across the office, bolting through the throng to the street door.

The next instant, jamming his hat down on his ears and without umbrella or overcoat to protect him, Mr. Pincus scuttled up New Street in the rain.

ght!"

It was true, indeed, that Blake—now a wreck, a battered stray—had once saved Mr. Pincus from disaster. But for him, Mr. Pincus' day in Wall Street would have come to a sudden end.

Mr. Pincus did not wish it to end. Least of all did he wish it to end like that. His plans, like the plans of every dabbler, involved a different, more exhilarating exit. This was the killing he talked about; but even then, even if he did make this killing, the clean-up that all the dabblers dream of, that did not of necessity mean he'd quit the Street for good. If he liked he could still take an occasional flyer. The flyer would be just for amusement, of course—just to pick up a little lunch money or to buy his wife a Christmas present. But to go broke, to be chucked out, penniless—that was different!

The calamity, as expressed, however, was not limited only to this. In Mr. Pincus' mind it seemed to invoke in train certain reflections concerning the Bleecker Street dress-linings trade, a business, it appeared, with which Mr. Pincus once had been connected. Somehow, the mere thought of it made him shudder. Return to that! Go back to that grubby place, the loft in Bleecker Street!

"*Ach!*" ejaculated Mr. Pincus, the grunt expressive.

It had been touch and go, however. Only chance had saved him. Just when Rooker, Burke & Co. had been about to sell him out, Blake had come to his rescue. The loan he had made Mr. Pincus voluntarily had saved the day for Mr. Pincus.

But chance, it ap

was:

"Do you want to be rich? Rich!" shrilled Blake.

"Do I vant to be vat?" inquired Mr. Pincus.

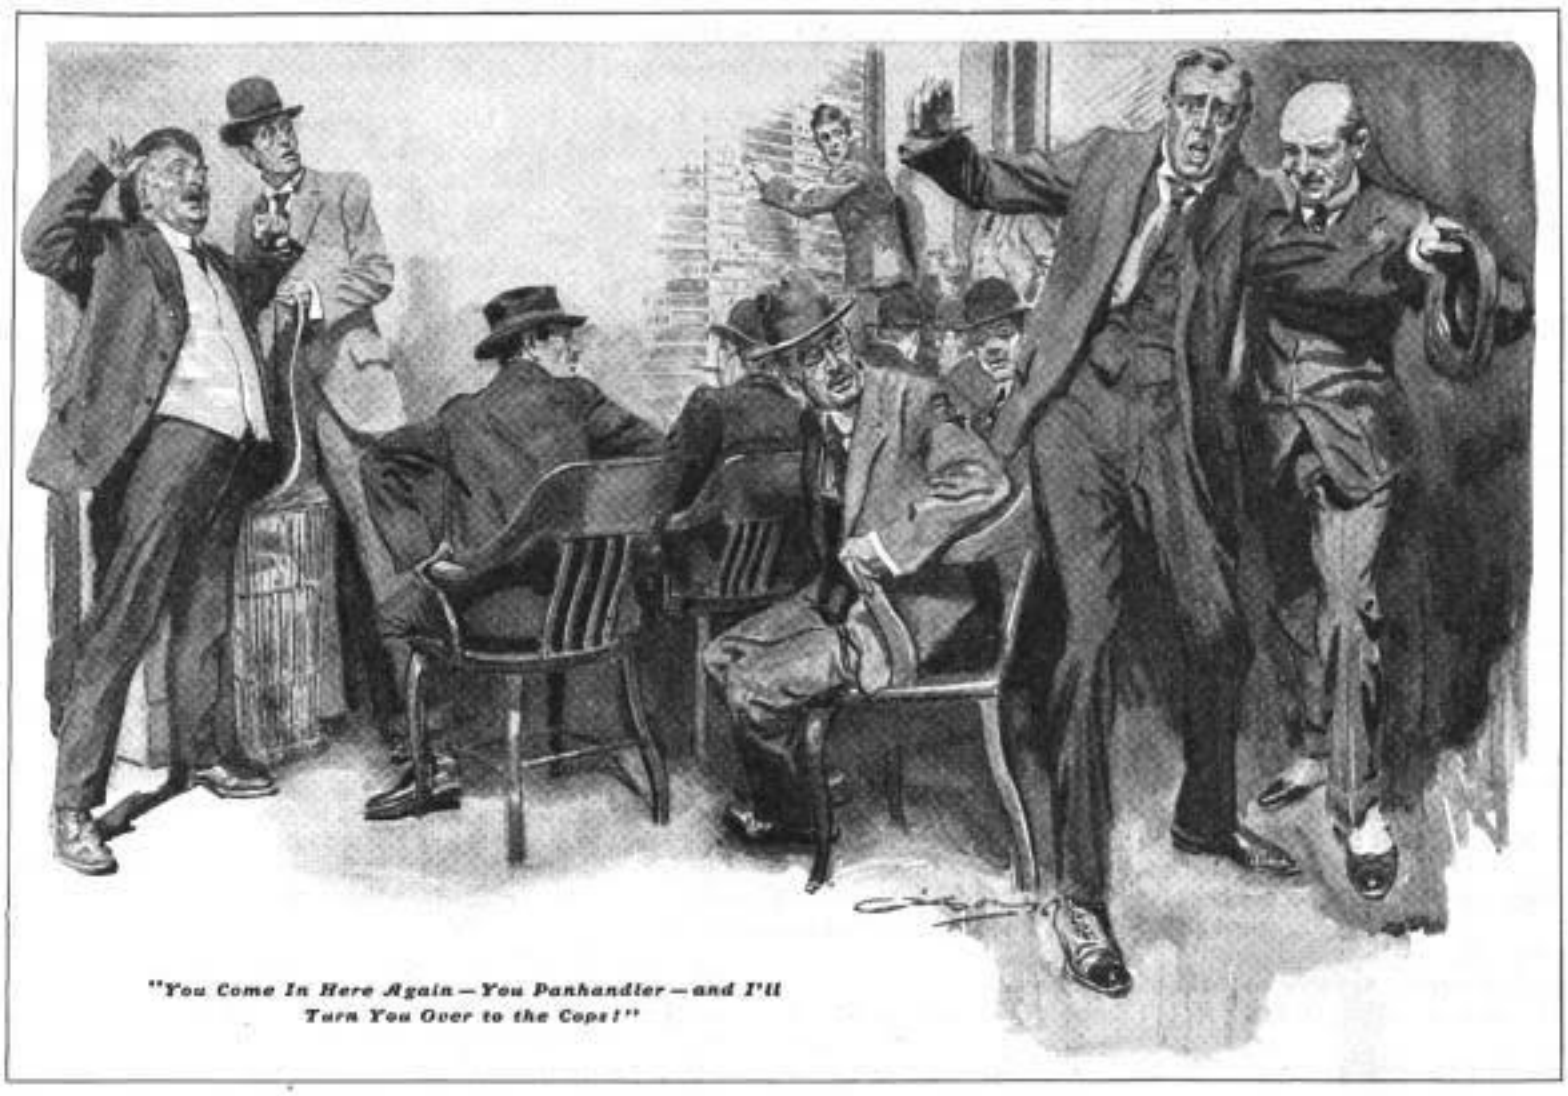
"Rich! Rich!" shrilled Blake. When Mr. Pincus, grinning slightly, lightly admitted he had no objections, Blake pawed at him again. "I can do it, Pink! I can make you rich!" cried Blake again; and, sniffing slightly, Mr. Pincus took him by the arm.

"Come along, feller; you feel better after you eat," he was saying, when Blake snatched his arm away.

"Say, listen! D'ye hear?" snarled Blake. "I mean it!"

His eyes fierce, roaming everywhere as if he feared someone might hear his secret, for a full minute he poured into Mr. Pincus' ears a flood of fierce, impassioned words.

How Blake, too, had come by the tip was as much a nightmare as all the rest of it.



Blake, it seemed, had fallen very low. Unable to find work—the sort, at any rate, he was suited for—the man had gone from bad to worse. Finally, to save himself and his wife from want, he had become a porter in a downtown office building. There he had swept out offices and emptied wastepaper baskets. There, it happened, too, he'd fallen on his tip.

One night, broom in hand, Blake had opened an office door. To his surprise, he'd found the room filled with men. It was a directors' meeting, Blake had seen; and at the meeting something big was happening. An hour later, after they'd gone, he'd slipped back to the room; and there the papers in a scrapbasket had given him his clew. The meeting was a meeting of the Ingot Furnace Company. Blake's tip, in fact, was on the same stock that Thurlow, that "two-spot," had been tipped.

There was this difference, though: Thurlow had been tipped to sell. Blake's tip was to buy! In other words, the company's directors, getting together, planned that well-known financial diversion—namely, jobbing the stockholders out of their stock.

Armed with the tip, for five days Blake had hurried from place to place, hunting up former friends and begging each for a loan. To each he had told his tip and each had laughed in his face. Buy Ingot Common? Put money into a cat-and-dog like that? Desperate, Blake at last had gone to Rooker. In turn, Rooker, too, had laughed at him; after which Rooker had thrown him out of the place.

Mr. Pincus, however, had not laughed. Instantly he had grasped the significance of what Blake had told him. It was to little purpose, though. Mr. Pincus was broke—"bust," indeed, as he'd expressed it. Unless luck, another chance, happened to save him, one sure thing stared him in the face. It was Bleecker Street and the dress-linings trade.

"You Come In Here Again—You Panhandler—and I'll Turn You Over to the Cops!"

at him with trembling paws.

Idly Mr. Pincus listened. It was as if he humored Blake, placating him as anyone would placate a man crazed by his privations. All at once, though, Mr. Pincus' air of bored benevolence suffered a sudden change.

"Vat?" he ejaculated.

Again Blake poured into his ears the fire of his impassioned eloquence; and, with a gasp, Mr. Pincus gaped. Blake again went at it. He was in the midst of it once more when, with a start, another ejaculation, Mr. Pincus gripped him all at once by the arm.

"Vat!"

"I pledge you my word!" said Blake; and, at that, excitement seemed to burst within Mr. Pincus' breast.

"Here!" he cried; and, shoving a hand into his pocket, Mr. Pincus dragged out a single rumpled bill.

The bill was a dollar bill; and, this in hand, he was thrusting it on Blake, bidding him to go eat; he must get a jump on and get back to Rooker's; there was not a moment to lose. Mr. Pincus was darting away, when he paused, with a sudden cry. It was a loud cry too. The bill falling from his hand, fluttered to the floor.

"Why, what is it?" ejaculated Blake.

His face blank, his air of a sudden abject, Mr. Pincus bent down and picked the bill from the floor.

"Oh, nothing," drawled Mr. Pincus, and he sighed—"nothing; only I guess for you and me, Blake, we go jump off the dock in the river!"

"What's wrong?" Blake demanded hoarsely.

Mr. Pincus told him:

"I'm bust, Blake! I ain't got a cent in the world! This week again the market cleans me out."

It was so. Once more Mr. Pincus was on the rocks. That was why, when Blake, desperate, had appealed to Rooker, and Rooker had thrown him out, Mr. Pincus had sat there, to every appearance callous and indifferent. He could not help Blake. He could not even help himself. Bleecker Street and the fancy dress-linings trade beckoned him anew.

What is more, it beckoned when, with a little cash, a little capital, Mr. Pincus could have saved himself. With money to back him, he could have jumped into the market and made a clean-up—that killing he so long had dreamed about. For Blake's tip was a knock-out. It was one tip in a thousand!

Late that night, long after dusk had fallen and an hour or more behind the time he usually arrived at home, Mr. Pincus climbed the stairs of the modest West Side flat house where he dwelt; and, arriving at his door, for a moment he halted irresolutely, his latchkey in his hand. Doubt, an air of unwonted concern, seemed at the moment to engulf him; and, gazing at the door, he took off his hat and scratched his head reflectively. He looked, in addition, a little feverish.

All that day, his eyes afire and the fever growing in him, Mr. Pincus had been rushing about the town. Like Blake, he, too, had sought out friends of his, begging and beseeching them to advance him enough to play the tip on Ingot Steel. Most of the friends were centered in a certain quarter—Bleecker Street and the dress-linings trade; and each of the friends, as was also the case with Blake, had laughed in Mr. Pincus' face. What! Lend money to dabble in stocks? Lend money, especially, to play that cat-and-dog Ingot Furnace Common? Pincus must be crazy with the heat!

That gentleman, however, had one string left to his bow; and jamming on his hat, with a sudden air of resolution, he opened the door and stepped boldly into the hall.

At once a voice as well as a gust of aromatic vapor came wafting toward him from the kitchen, at the rear. The vapor was that of fried fish and cauliflower, while the voice was that of his wife. Instantly an artful smile spread on Mr. Pincus' face.

"Vell, Minnie?" chirped Mr. Pincus dulcetly.

"Vell, Benny?" responded his wife.

Like her husband, the lady was short and rotund—roly-poly, in fact, with a round, smiling face at once as shrewd as it was good-natured. As she came down the

Mr. Pincus.

Pincus!" was her reply.

An hour later, tossing fit-
was, in fact, still choking.
. A groan, a hollow note of
him, when a hand reached
s in the side.

"Listen, Pincus," said Minnie; "if you gamble, playing stocks, how much is it them fellers, your broker, charges you?"

"Vat?" ejaculated Mr. Pincus.

Minnie repeated the question; and, startled, a gleam of hope springing into his heart, Mr. Pincus babbled the information. What a broker charged was an eighth for each transaction. Also, with three thousand dollars, one could margin three hundred shares. Eloquent now, his fever rising anew, Mr. Pincus gave her all the details. Then, his heart in his mouth, hope trembling high, Mr. Pincus wet his lips.

"Vell, you make me a check out, vat?" he suggested.

A grunt was heard.

"Go to sleep, Pincus," directed Mrs. Pincus.

"Vat? You make a fool of me, then?" roared Mr. Pincus.

Minnie only gave another grunt.

"If you are a fool, Pincus," she replied calmly, "that is your affair."

Then, turning her back to him, Mrs. Pincus slept.

The tip, that pointer worth a fortune, was destined, it seemed, to die on Mr. Pincus' hands.

Those familiar with the doings of that crop of singular securities, the War Babies, to which Wall Street has of late given birth, will recall that it was on a Tuesday morning, just after the market's opening, when Ingot first began to splutter and buzz. That day more than one fortune was made in Wall Street. In train with this, more than one fortune was lost there too.

But then, that is always true of Wall Street. What one man wins is of necessity what some other man has lost. Only a few, however, the chosen few, had ever won anything on Ingot. Almost invariably outsiders always had lost.

Always in trouble, the quarry always of that Wall Street wrecking crew, who feast and fatten on disaster, the concern's career before the war was a succession of refunding, receiverships and reorganizations. Now, however, the war had changed all that. The Ingot Company was about to cut a melon. However, before the melon was cut, the directors meant first to secure for themselves the largest, the most juicy of the slices. Consequently, having picked up almost every share available, the instant the news broke the stock soared skyward with a rush.

At ten o'clock the market opened. Ingot was the first quotation. Having closed at 34 bid, a quarter asked, it opened with a whoop. The first transaction, a block of two hundred shares, was snapped up at 35. The next transaction was another three-quarters up. Five minutes later uproar raged in the market. The whole Street fought to get aboard; and in every brokerage office—Rooker, Burke & Co.'s among them—the uproar on the Stock Exchange was instantly and as wildly reflected.

"Ingot, a half—three-quarters! Five hundred Ingot at seven-eighths! Ingot, thirty-nine! A quarter! A half! Five hundred Ingot at forty! Ingot, forty-one!"

Mr. Thurlow, his mouth agape and his face now of a startling pasty pallor, stood gaping at the quotation board. The day before the gentleman's mood had been merry. When Blake, that stray, that has-been, had been ejected from the place, Mr. Thurlow had lightly laughed. But then, why not? Had not Mr. Thurlow had a tip? Was not the tip a hot tip too? In anticipation of the money, the riches that would accrue from it, there had been every reason why Mr. Thurlow should take things pleasantly. Now, however, the dream seemed somehow to have been shattered.

Tipped to sell, Mr. Thurlow had sold. That, in fact, was what the Ingot Company's director had expected when he'd given out the tip. Consequently, having sold at 34, Mr. Thurlow now looked as if he meant to faint.

His face moist and his lips wetting themselves together, he was still staring at the quotation board when Rooker tapped him on the shoulder.

Rooker's face wore a smile. The smile, however, was purely professional.

"Say, Thurlow," he said, "if it's convenient, I'd like a little check from you."

When Mr. Thurlow, a bit whiter, mumbled he'd let him have the check the next day, Mr. Rooker shook his head. He must have a check at once, he said; and, his face convulsed, Mr. Thurlow made an exclamation.

"What! You'd close me out?" he cried.

It was as he said. Unless he came across at once with a check, the firm indeed would close him out; and, his voice rising, Mr. Thurlow began to protest. It was not for long, however. "Here, you," ordered Rooker, his jaw ugly; "if you have any squealing to do you can't do it in here!"

Mr. Thurlow, however, did not heed. He had raised his voice even higher, shrill now in his misery, when Rooker, assisted by Beeks, the office manager, briskly escorted him to the door. Exit Mr. Thurlow, still squealing.

This commotion, however, had hardly subsided when it was succeeded by another. Ingot had just crossed 50 when, with a stifled cry, Mr. Pincus rose and launched himself across the room. Then, throwing open the street door, with another cry he bolted out into New Street, waving his arms as he went.

"Say," said one of the crowd, addressing a fellow trader in the chair adjoining, "what's biting Pincus? Crazy with the heat, huh?"

"Search me," replied the other gentleman. "Looked like he was tearing his hair!"

If so, Mr. Pincus had cause to tear his hair. At seven o'clock that day Mr. Pincus had risen. In moody silence having dressed himself, he had then repaired to the breakfast table. There, in the same submerged gloom having consumed a dish of prunes, a saucer of breakfast food, four slices of toast, a couple of eggs and two cups of coffee, he had kicked back his chair and lumbered to the door. His wife inquiring then whither he was bound, Mr. Pincus had turned on her with a savage glare—that and an equally savage answer.

"Vat's it to you? If it's to the river I go and jump in, vat do you care, anyhow?"

"Vell, don't get your feet wet, Pincus!" she had rejoined.

And, jamming on his hat, Mr. Pincus had turned on her again.

"Vell, I fool you, anyway!" he cried excitedly. "I bust, maybe! Just the same, I don't go back to them dress linings."

e-ee-eet . . . by um by . . ."

The front door opened with a bang, and a short bow-legged youth entered abruptly.

"'Lo, Lee!"

"'Lo, lilla kit!"

The visitor scowled and twitched a shabby cap lower over his eyes, which were gray, deep-set and older than they should have been. Fringes of yellow hair seemed to bristle behind each ear, and the muscles of his small but sturdy torso tightened under a ragged blue sweater.

"Aw, cut that 'little kid' stuff! . . . Is my shirt done yet?"

Lee Sing's loose slippers clipclapped on the floor as he moved over to the rack that contained his finished work. Selecting a small flat package from the pile, he examined the hieroglyphics scrawled upon the linen tag.

"Me ketch 'um," said Lee Sing, grinning pleasantly. "You ketch 'um dolla hop?"

"Now where would I get a dollar'n a half?" demanded the youth. "How many times have I told you the hoss ain't started yet?"

Lee Sing's face became perfectly blank; he took refuge behind the phrase at which the entire West has battered in vain.

"Me no sabby," said Lee Sing stupidly. "No sabby hoss. You no ketch 'um dolla hop, no ketch 'um laun'ly. Fo', fi', sixsa week—alla time you foola me. Alla time you say not yet—jusha one week maw. You hip no-o good!" He replaced the small bundle on the pile.

"Aw, listen, Lee!" begged the youth. "I know I've had to stand you off for a month or so, an' I'm sorry; but I've got to have that shirt. I've got to have it to-day!"

"Dolla hop, you ketch 'um," replied Lee Sing, unmoved.

"But I got to take my sister down town to see a doctor," pleaded the boy, "an' I can't go lookin' like a tramp! Have a heart!"

"Umph!" grunted the Chinaman. "Sista, she sick?"

"She coughs all the time, an' she's kind o' weak an' run down. I can't take any chances, lettin' it go too long. I want a doctor to find out what ails her, an' mebbe give her some medicine. That's why I need the shirt. I got to look as if I can pay a doctor's bill, anyhow!"

Lee Sing reflected for some time, his slant eyes half closed.

"When you ketch 'um dolla hop?" he asked.

"Next Friday!" said the boy desperately.

"Umph!" remarked Lee Sing, still far from conviction.

"Friday I got Ninespot entered in a race," persisted the boy, "an' I'm goin' to bring him home in front by a city block. He'll win sure, Lee!"

Lee Sing showed the yellow stumps of his teeth in an incredulous grin.

"Mebbe so; mebbe so not," said he, shaking his head. It was not the first time that a race-track customer in straitened circumstances had offered Lee Sing feed-box information in lieu of coin of the realm. "Mebbe so loosh 'um!"

"But he can't lose!" argued the boy, drawing nearer and lowering his voice to a confidential pitch. "You know how long I've waited with this hoss, just to get him placed in a soft spot. Well, Friday's the day; an' there ain't a thing in there for him to beat—not a thing! I'll have money Friday night—all kinds of money; but I got to have that shirt now!"

"Dolla hop," murmured Lee Sing, weakening.

"But Jennie can't wait till Friday," urged the youth, pressing his advantage.

"She ought to see a doctor this afternoon an' get something to stop that cough! Aw, be a good feller, Lee!"

"You no foola me?" demanded the Chinaman, with a shrewd glance out of the corner of his almond eyes. "You no tell 'um lie?"

"Cross my heart!" cried the boy with sudden passion. "Cross my heart an' hope to die if it ain't the truth! Jennie's sick, I tell you; an' I got to take her to the doctor. You think I'd lie about a thing like that?"

Lee Sing sighed heavily and picked up the small bundle again.

"Aw light," he grunted. "Nisha time aw light. . . . Me hip dam' fool! . . . Fliday, you ketch 'um dolla hop?"

"You bet your life!" The boy snatched the bundle from Lee Sing's hands and moved toward the door; the Chinaman followed him swiftly.

"You hoss," said he, "what him nem?"

"His name's Ninespot, I told you; an' he goes in the sixth race, Friday. Ninespot—sixth race—Friday—got that?"

"Ni'spot," repeated the Chinaman, and a sudden smile bisected his grave countenance. "Ni'spot, Chinee lottelly, him plitty dam' good; ten-spot mo' betta!"

"Gee, but you're a bug on that lottery stuff, ain't you?" asked the boy, pausing at the door. "And say, you got as much chance to land a ten-spot as—as I have to win the American Derby with the awful oat-hound I got in my barn!"

"Bimeby ketch 'um, git plenty money," replied Lee Sing, grinning vacuously. "Ten-spot losh money, kit; all sem lich!"

"Lots of money, eh? Well, go to it, Lee; I'm for you. You're a good feller at that!"

"Uh-huh," was the dry response; "jusha now me dolla hop good fella. Me sabby you. You come back Fliday?"

"Just as sure as the sun shines!"

The boy leaped out into the chill December breeze, hugging the flat bundle to his breast.

"Billy," said he to himself, "what's goin' to become of you? You lied like a common tout—lied to a Chinaman to get a shirt an' make a front so's to stand off a doctor! Ninespot! They flattered him when they named him! An' you said he'd win sure! I'm ashamed of you!"

Inside the frame shack Lee Sing continued to wad damp garments into little balls, and the quavering melody rose and fell, while the swaying queue marked time:

"In uh swee-ee-eet . . . by um by . . .
We sha' lest on 'at beau-tee-fu' shaw,
Beau-tee-fu' shaw."

"Haw!" chuckled Lee Sing, and followed his chuckle with an avalanche of guttural sounds, which being interpreted into pidgin English gives us the following bit of wisdom:

"Ni'spot, him plitty dam' good; ten-spot, mo' betta!"

II

WHEN old Tom Randolph closed his eyes on a world of change and chance he left an estate consisting of a spotlessly clean record on the American turf, an excellent

Digitized by Google

"It's a mean trick, Billy," Old Tom had said after the doctor had told him the truth; "yes, a mighty mean trick, leavin' you like this—you an' Jennie. You'll have to watch her pretty close, my boy. She's inclined to be delicate, like her mother was, an' she'll need lookin' after. . . . I ain't askin' you to promise me, sonny. I know you'll think of her first always. . . . The racin' game ain't what it used to be before bookmakers began buyin' stables of their own; but if you stay with it, Billy, run your hosses on the square—I expect you'll be ridin' a couple of seasons yet. Don't never ride for a man that wants you to do wrong, an' remember what I told you 'bout makin' a low weight if it hurts you. It ain't worth while ruinin' your health. . . . And now, if you'll bring Jennie in. . . . I'm in the home stretch, sonny, an' finishin' fast."

For two years Billy had preserved his father's estate intact. Old Tom's turf record had not suffered by any act of his son; the split-second stop watch had not left the Randolph family for as much as an instant, and the worthless Ninespot had a roof over his head and oats to eat—oats he had not earned. By riding for other owners Billy had been able to keep a horse of his own—not much of a horse, to be sure, but still a thoroughbred and the sole survivor of the Randolph Stable.

And now, at the end of the second year, Billy Randolph sat on the porch of a three-room cottage in the rear of the barns and faced a crisis all too serious for his years.

It was night, and a dense fog had drifted in from the ocean, swallowing up the stable lights and blotting out the low even lines of the buildings where the thoroughbreds were quartered. A medley of sounds came to the boy out of the thick gray pall—some of them amazingly close at hand, others muffled and indistinct—snatches of camp-meeting melodies crooned by negro hostlers and roust-abouts; shrill cries of youthful gamblers, bending over the dice in some near-by but invisible tackle room; occasional bursts of loud laughter, marking the point of some rude joke. Billy Randolph heard these things but did not heed them. He sat with his chin in his hands, while the fog slowly took the stiff-ness out of the bosom of his clean white shirt.

A door creaked behind him, and a girl's voice caused him to turn his head.

"Billy, you mustn't set out there in the fog! You'll ketch your death o' cold!"

"Shucks, Jen! I'm warm as toast! Run along to bed, an' don't bother about me. I'll be in after a while. I'm waitin' for George th' Greek."

There was a short silence. The door creaked in an undecided manner but did not quite close. A pencil of yellowish light still glimmered through the fog curtain.

"Billy?"

"Well?".

"You ain't worryin' about it, are you, dear? You know you can't do any more'n just your level best. I'd rather stay here with you, Billy, than go down there among strangers. Don't let it bother you."

The boy laughed harshly. "Bother me? I should say not! Didn't the doctor tell me you'd be all right once you get out of this damp foggy climate? Well, we're goin' to get out. I'll land you in Arizona if I have to make Ninespot carry double. Right at present, I'm figurin' ways an' means—mostly means. . . . Hike, now—here comes somebody!"

The door closed softly as a figure loomed through the fog.

"That you, Billy?"

"What's left of me, Greek. Set down; I want to have a talk with you."

Now George the Greek was really not a Greek at all, neither was his first name George. The alias had been bestowed on him because of an olive complexion, dark dreamy eyes, and a mop of blue-black hair, inclined to curl. When he had money, which was seldom, he could be found vibrating between the paddock and the betting ring, and he had once been four hundred dollars ahead of the game for almost half an hour. When he had no money he worked and earned it, in this respect differing from many turf followers.

"Plenty. In the first place, it's her lungs. That was my guess all along."

George the Greek made a clicking noise with his tongue and shook his head sorrowfully. Because he found nothing to say, he patted Billy's knee.

"Cheese!" said the head of the Randolph household. "It ain't as bad as that! It's only in the first stages. The doctor says I got to get her out of this foggy climate."

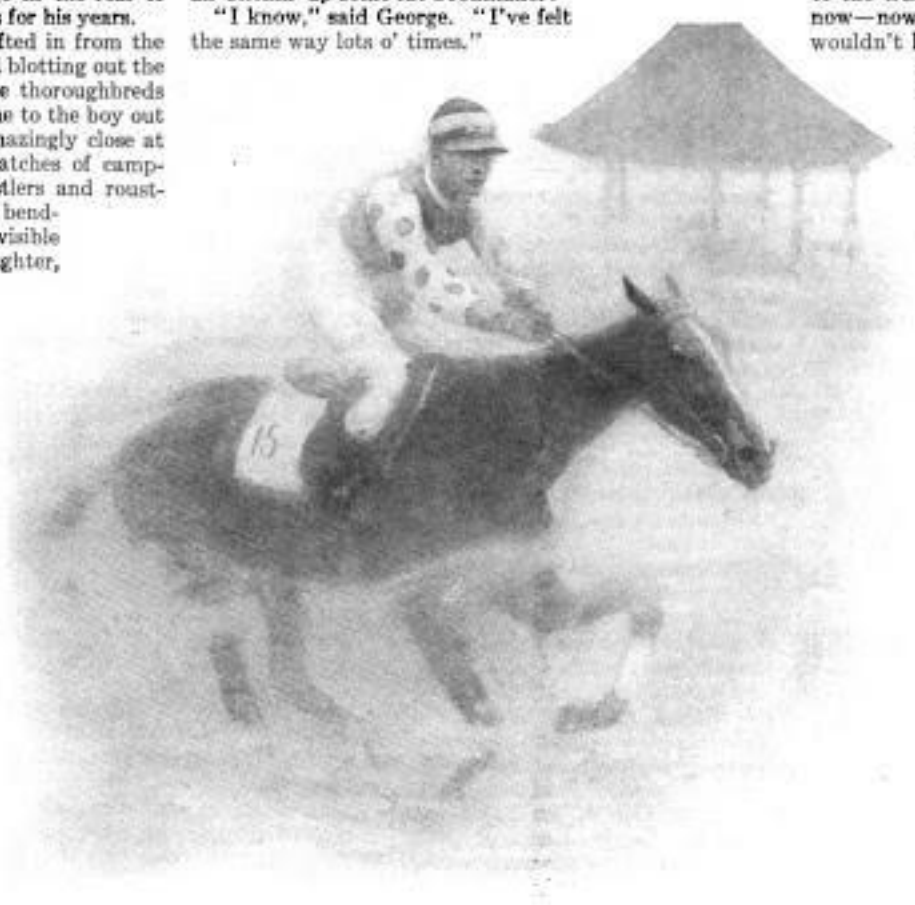
"Sure!" said George the Greek, and swore softly at the fog.

"Go as far as you like!" said Billy. "You don't hate it any worse'n I do—on her account. It's the fog that brings on all her coughin' spells. . . . Arizona or New Mexico—that's what he said. Might as well ask me to take a trip to the moon! Arizona's a long ways off."

"We'll do it somehow," said the Greek.

"But it's got to be done quick. If we take it in time she can beat the game yet. If she stays here ——"

"No 'if' about it. You got to get her there in a hurry."



"But how? That's what stops me—how?"

George the Greek rolled a cigarette and blew a cloud of smoke into the fog.

"Couldn't you sell Ninespot?" he asked.

"Humph!" grunted Billy. "That big hound? Why, I couldn't give him away! He ain't worth thirty cents. . . . I tell you, Greek, I feel like goin' out with a gun an' stickin' up some fat bookmaker!"

"I know," said George. "I've felt the same way lots o' times."

Billy Thoughtfully Guided Ninespot Well Into the Middle of the Track

"I got Ninespot entered in a race next Friday," said Billy. "It's a Burglars' Handicap if ever there was one—all the bad hosses at the track are in it. The route is a shade longer than he likes—seven-eighths; but if he runs up to his best work he stands an outside chance. Jim Barlow has got his big black hoss in there ——"

"Ace of Spades?" asked George.

"That's the baby. Ace of Spades is quite a hoss. He outclasses this bunch—can win in a walk if Barlow's tryin' with him. Trouble is, you never know what Jim's doin' till he's done it; an' by that time they're payin' off. He's been cheatin' with the black hoss lately—waitin' to get a price, I reckon—an' he may not be ready to cut him loose on Friday.

"If he ain't it's anybody else's race, an' Ninespot'll have as good a chance as most of 'em. . . . If I only knew about Jim ——"

"Maybe I can find out," said George the Greek hopefully. "I know a couple of swipes that are working for Barlow."

"Jim's too foxy to tip his mitt to stable hands," said Billy.

"You goin' to take Ninespot out in front?" asked George the Greek.

"Yes; an' if anybody beats that barrier next Friday it'll be me. The only good races the big hound ever ran were the ones when he had the jump on the bunch. He ain't got no heart, Greek. He quits as soon as they come up 'longside of him. . . . A big yellow hound! . . . An' that's the only hoss left to run for the Randolph Stable—in a pinch like this!"

"He might not quit Friday," said the optimistic George the Greek.

"He better not!" was the savage rejoinder. "If he does quit it'll be after the worst lickin' a race hoss ever got! I hear Jennie movin' round inside. Reckon I ought to go in an' talk to her—cheer her up a little."

"Is—is she scared, Billy?"

"She wouldn't ever let me know it if she was," replied the boy. "I wanted her to go in the next room while I talked with the doctor alone. Think she'd stand for it? Not in a thousand years! It was the truth she was after. And game? She's so game that I kind of choke up when she talks about the little cold on her chest. . . . That's what she calls it—a cold on her chest. Can you beat her?"

"Listen!" urged George the Greek, with a sudden inspiration. "You tell her I had an aunt once that was awful sick—lungs all shot to pieces. They had to carry her to the train on a stretcher—that's how bad she was; an' now—now she weighs a couple of hundred pounds, an' you wouldn't know there was ever anything the matter with her! Honest, you wouldn't! That's what Arizona done for my aunt; you tell Jennie."

"Is this aunt business on the level?" demanded Billy sternly.

"Aw, what difference does that make?" growled George the Greek. "You tell her anyhow. It may do some good!"

III

THERE are great souls to whom a little luck is only an aggravation. Not content to accept the small favors flung them by the blind goddess, not satisfied to touch the hem of her garment, these bold and greedy adventurers essay to pick her pockets and loot her of the capital prize as she passes them by. A very few believe that this can be done. As a general thing, the belief costs them money and heartaches.

It was on a Thursday afternoon that Lee Sing "caught a ten-cent seven" in the daylight drawing of the Quong Hop Lottery Company, and thus found himself richer by the sum of eighteen dollars and seventy-five cents. Another lowly dabbler in soapsuds might have rejoiced; but Lee Sing only sneered as he wound his queue about his head and prepared to board the street car for Chinatown. He regarded a ten-cent seven as very small fish indeed—fit for nothing but to be used as bait in the snaring of a leviathan.

From the lottery headquarters it was but a step to the establishment of old Sam Wing, ostensibly a respectable merchant, really a pillar of the gambling trust. In his dingy basement, where a million shopworn odors fought for mastery, and some were defeated but none died, Sam Wing defied a city ordinance by operating a dice game known to the initiated as four-five-six.

Night and day the ivory cubes rattled and spun in the big blue bowl; and the stakes changed hands, sometimes with amazing rapidity, for four-five-six is the sort of game where the speculator gets action for his money.

Lee Sing clattered down the basement stairs, with his nose in the air and many silver dollars clinking in his pockets. To-night is always the night when a Chinaman has money he has not earned.

Sam Wing, a frail little mummy done in wrinkled yellow parchment, peered through the smoke of cigarettes and rank Chinese-made cigars and nodded at Lee Sing, who nodded politely in return.

About the large round table were the gamesters—white, black, yellow and brown. Plump, smooth-skinned Chinese dandies were jostled by negroes and Mexicans; white men, their dead eyes and sallow cheeks marking them as opium smokers, made room for coolies and Japanese vegetable growers. Lee Sing saw at a glance that it was a good game, with plenty of money in sight. He edged his way in to the table, thus inconveniencing a white boy in a

third dime, reserved as car fare, Lee
bloke."

ning dawned raw and cold, and Billy Ran-
hattered as he opened the door of a stall and
arge chestnut horse, which did not seem par-
to see him.

"Aw, behave yourself!" scolded the boy. "I ain't goin' to gallop you this mornin'. I'm saving everything you got for this afternoon, you ornery oat-hound; an' oh, if you ever tried in your life, try for us to-day!"

It was also cold in Lee Sing's shack, and the laundryman shivered as he picked up a folded paper which had been thrust under his door by his friend See Yit, an early-rising vegetable peddler. It was the same sort of slip that Lee Sing had marked the night before, but twenty of the characters had been punched out—the lucky twenty, which had been drawn by lot at midnight in the cellar of the Chow Loon Company.

Lee Sing's sleepy eyes widened as he examined the "drawing." Hastily he compared it with the duplicate preserved for that purpose, and an explosion of strangled gutturals escaped him. The next instant he snatched his slouch hat from its peg and dashed out of the place, his queue streaming behind him, snapping this way and that like a blacksnake whip.

IV

THE day continued raw and cold, with a hint of rain in the air. The rain did not come, but the afternoon breeze brought the fog in from the Farallones—only a shred or two at first, driving low across the infield; then a pearl-gray haze, clinging close to the ground; lastly the main body of the fog bank itself, rolling swiftly in from the sea, obliterating landmarks, obscuring the sun and hastening the dusk of a winter evening.

The fourth race was run through scudding patches of mist; the fifth, in a haze which almost hid the upper turn; and when the bookmakers posted the prices for the last event objects fifty feet away were blurred and indistinct, and rapidly becoming invisible.

George the Greek, acting as hostler for the Randolph Stable, brought Ninespot to the paddock, where fourteen other horses were waiting for the saddling bell. The Greek scowled as he recognized several of the owners.

"Billy called it!" thought he. "Burglars' Handicap is right. Every thief on the track has got a horse in this race. Question is, How many of 'em are tryin'? . . . Jim Barlow ain't—that's one good thing. . . . Ace of Spades looks fine, though—looks ready."

The bell brought Billy from the jockey's room—a stocky little figure in the shabby colors of the Randolph Stable. George the Greek saddled Ninespot under the critical eye of the owner, and the boys engaged in low-toned conversation as they waited the signal to mount.

"My—oh! What a fog!" said Billy. "Jen wanted to see the race; I'm glad I told her to stay home."

"Nobody'll see this race," said George the Greek. "It's thicker than soup out there. . . . Fine chance for rough stuff on the upper turn; the judges can't see any fouls. Better look out for some of these fellers."

"They better look out for me!" said Billy, fumbling in the leg of his boot. "I'm desperate enough to do'most anything."

He straightened up and showed the Greek a twenty-dollar note folded small in the palm of his hand.

"Where'd you get that?" demanded George.

"I borrowed it on the watch," replied Billy. "I'm takin' a chance that you got the straight dope on Ace of Spades."

"Both of Barlow's boys told me Jim wasn't tryin' to-day," said George the Greek. "They told me the black horse wouldn't be anywhere."

"I hope you're right," said Billy; "an' I'm goin' to gamble that you are. Stand over here and I'll drop this in your coat pocket. I don't want anybody to see me slip it to you—it might start a lot of pikers to playin' Ninespot. . . . Now this is what you do: Wait till the very last minute, an' then slip into the ring an' get me the top price on him to win. He'll go up in the bettin', sure; you ought to get fifty or seventy-five to one."

"Hadn't I better put ten on the nose an' ten on the limb?" asked the cautious George.

"Put it all on his nose!" ordered Billy. "Every nickel! He'll win or he won't be nowhere; an' if it comes to a cleanin' I might as well be cleaned right. What good will a stop watch be to me—in Arizona?"

"There's something in that," murmured George the Greek.

"I haven't told Jen," continued Billy; "so be careful an' don't spill it. She'd feel bad if she knew I hocked the watch. If Ace of Spades is in the morgue to-day I got as much chance as the rest of 'em; an' this big hound will certainly get a sure-enough ride, no matter where he finishes."

Somewhere in the fog a bugle blared shrilly.

"Good luck, ole pal!" said George the Greek as he hoisted Jockey Randolph into the saddle. "If wishin' was winnin' ——"

"I know," said Billy; "but it ain't. That's the hell of it."

The fifteen thoroughbreds passed the grand stand in a ghostly procession, invisible to all but the judges and the spectators near the fence. Even at this close range it was difficult to read the numbers on the saddlecloths, and the presiding judge shook his head at his assistant.

"I don't remember ever seeing it quite so thick as this," said he.

"Nor me," remarked the other. "It'll be just our luck if about seven of these skates take it into their heads to finish noses apart. That'd be lovely, eh? Better run through those colors again, I think. Let's see—red jacket, white sleeves, white cap—that's Harrington's horse; purple jacket, green sleeves, purple and green cap—that's the Denver Stable ——"

Billy Randolph, jogging along at the extreme end of the line, urged Ninespot a bit and soon found himself touching elbows with Jockey Sanderson on Ace of Spades. Sanderson, who was young in years but nevertheless an able business man, was cursing several things, among them Jim Barlow, his heirs and assigns forever.

"What's it all about, Sandy?" asked Billy.

"Barlow crossed me," answered Sanderson, and continued to free his mind.

"Crossed you? How?"

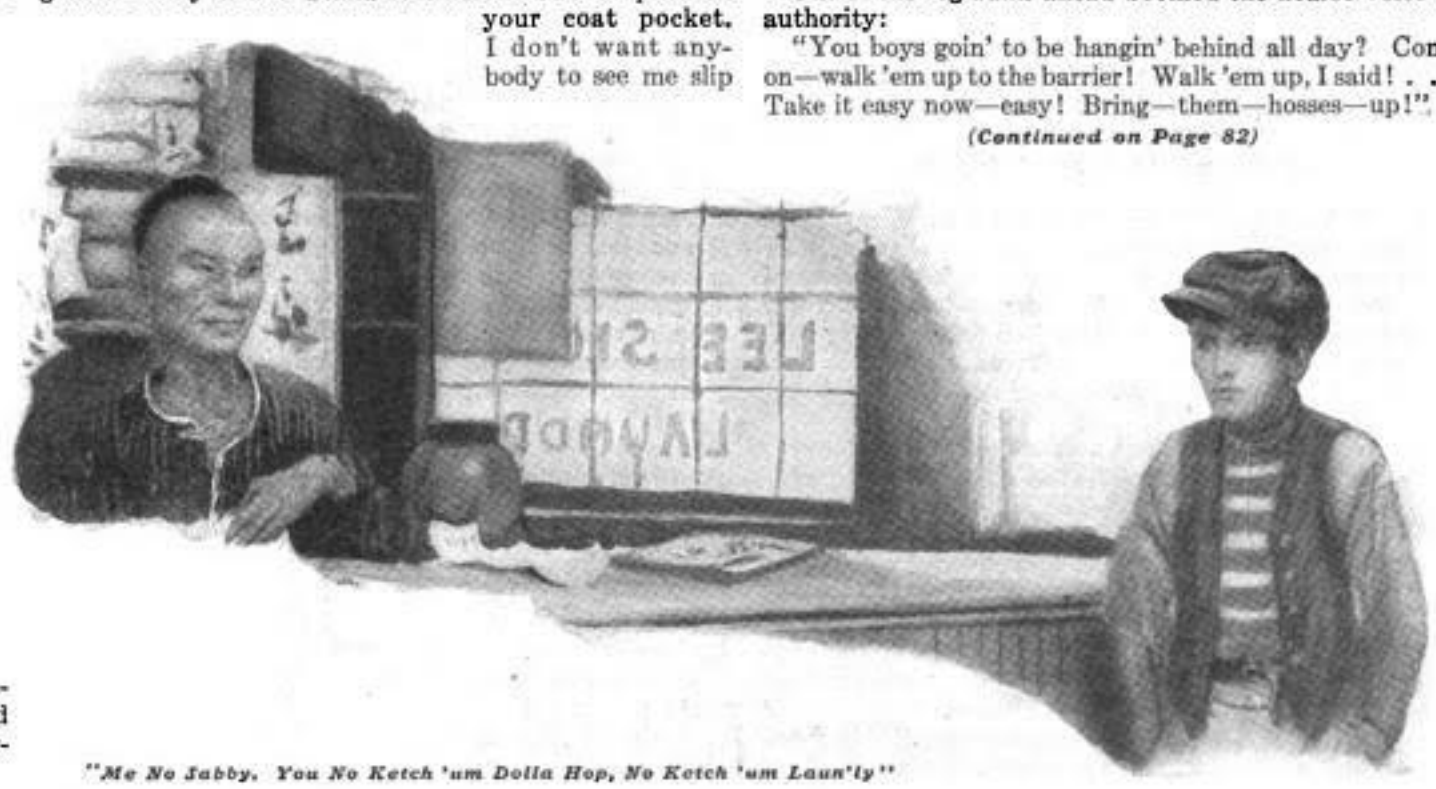
"He told me he'd let me know when he was goin' to turn this one loose, so I could bet some money on him. . . . Barlow never bet a dime for a jock in his life."

The cold seemed to strike Billy Randolph through and through.

"Why," said he, "I—I understood Ace of Spades wasn't—wasn't ——"

Jockey Sanderson interrupted him with a savage oath:

"So did a lot o' people! So did I! Last night Jim Barlow told me this race was just goin' to be another one of 'them things.' Then, at the last minute, when there ain't a chance for me to flag my bettin' c'missioner, Jim breaks it to me that the stable money is down, an' gives me orders to take this baby out in front an' never look back! I leave it to you if that ain't a rotten trick!"



Billy Randolph did not answer. He could not speak.

"It's all right to job the bookmakers an' the public," complained Jockey Sanderson; "but a guy ought to be on the level with his stable c'nections. Here I been grabbin' this bird every time out, messin' him all over the track, bringin' him home outside the money, takin' a chance on bein' set down by the judges; an' now, when Jim gits ready to send him for the checks, he don't even tell me! He's a fine stiff, he is! Why, if I ——"

Out of the fog bank ahead boomed the hoarse voice of authority:

"You boys goin' to be hangin' behind all day? Come on—walk 'em up to the barrier! Walk 'em up, I said! . . . Take it easy now—easy! Bring—them—hosses—up!"

reen and gold in July. And in August came the
lf-rake reapers, the old droppers and the harvest-
h with two men binding and riding at the same
d the headers spouting geysers of wheatheads into
oard boxes.

hen the prairie became freckled with shocks, which
athered into groups of hive-shaped stacks, after
he threshers went about filling the air from daylight
r dark with the hum of the cylinders, rising and
ike the voice of no other machine, in a long, waver-
sical pæan of triumphant plenty. Then came the
burning straw piles, and the stubble fields were
cored with broadening black ribbons of plowed
roadening until all was black again; and the
wore deep grooves in the earth as the crop went to
the railway, sometimes as much as forty miles off. And then in the spring there went into those fields another crop of wheat.

Not for too long a time, however, would Nature allow this to go on. There came a time when something mysterious was seen to be the matter with the wheat. It came up as rank as ever, it grew as tall as ever, its heads were as long as ever; but the straw, which used to turn to gold from green, now bore black specks and turned brash, so that the heads would pull off the bands when we cinched up the sheaf before tucking it in. Sometimes, too, our boots would be red with rust from the wheat straw, and at other times the wheat would stand shoulder-high and filled with kernels, when some terrible thing would shrivel the grains almost to chaff.

We waded through deep waters in those days. Nobody knew what the trouble was, though we had all sorts of theories. Now the professors in the colleges of the spring-wheat states have found out that when wheat is sown after wheat, as we sowed it, there are fungi and bacteria which fill the soil and pervade the country. But, though we suffered from them, we did not know they existed. Nobody knew then. Such knowledge belongs to the age of the college of agriculture and the county agent.

We quit growing wheat, finally, and corn became our great crop. Then our states became the Corn-Belt States. Now one may see as much corn as then we saw wheat. It is as beautiful as the wheat, but it is different. Not warned by Nature's protest against a one-crop system, we planted corn after corn. And recently we have begun to see that this, too, is a mistaken policy. Then wheat came back; but this time it was not spring wheat.

In my young manhood, here in the Corn Belt, we had no winter wheat that would resist the severities of our winters. But twenty-five years or so ago Russian immigrants brought to Kansas varieties of winter wheat which are more hardy; and these have gradually made their way north until they are now grown in Alberta, where the season is so short that this year's harvest must be taken off after next year's seed is sown.

Young Men With New Methods

THIS wheat has been perfected by the plant breeders of the colleges until it is better than when the Russian immigrants brought it over. It brought wheat back to Fairview. We began slowly to adopt the Ohio Valley rotation—corn, then wheat, then clover.

Now this new system found us all out of practice in wheat growing. We had never been much troubled with chinch bugs and not at all, to speak of, with Hessian fly; but now both these pests were upon us. About the time that I, at least, had come to the conclusion that I had forgotten a lot about wheat, and that there was another lot I had never known, a county agent was hired for our county.

We in the Fairview neighborhood took very little interest in him and his work. We thought we had in Tom Whelpley and the school, and in Frank Wiggins and Daisy, his wife, and the Fairview Meetinghouse, a good deal more than the county agent could give us in the way of aids to rural progress. We were, perhaps, a little uppish and conceited in the matter.

But the county agent didn't feel that way about us; in fact, he disarmed us by coming to our meetings every Sunday and levying on Tom and Frank for help in his work. He said it was not often that a county agent came to a county in which his work was so well started in an influential neighborhood. If he could just get the Fairview spirit and the Fairview Idea, he said, spread all over the county, he would consider his work there a success.

Now what can you do against that sort of approach! Nothing but turn in and help. And after a while we discovered that not even a Tom Whelpley knows everything: and that the keen young fellow who is making a business of gobbling up every bit of new knowledge, as soon as it is knowledge, is sure to be a few laps ahead of the best of us—except in the general and old-established practices of farming, in which, of course, we old stagers naturally know more than anybody else.

real farming experts of the country, aside from the successful farmers, are found in the ranks of the county-agent force of the Bureau of Farm Management of the Department of Agriculture at Washington, working with the farmers in the various counties to which they are accredited under the Smith-Lever Act.

All that can be done to check the ravages of chinch bugs after harvest Freeman Clay showed me how to do; I had read of it of course, but it had gone into my brain at the eyes and oozed out at the back of my head, as most things do that we read. That's the value of the county agent to the fairly well-informed farmer: he makes real the things which otherwise remain wrapped in the haze of matters only read of. Only scholars really visualize things that are merely read.

Old Dr. Seaman A. Knapp, father of the county-agent movement and, I think, the greatest educator America ever produced, once said to me: "When a man reads a thing he doesn't know it. When you tell it to him he doesn't know it. When you actually do it before his eyes he still doesn't know it. He never actually knows a thing until he does it with his own hands and brains!"

On the other hand, a friend of mine in New York, who likes to deal in contradictions, is fond of saying that you can't teach any person anything he doesn't already know.

Both these men are absolutely right. I knew, in the way one of them meant, how to check the invasions of chinch bugs marching from the stubble into the corn; but I never really knew it in the way meant by the other until after I had worked it out with Freeman Clay, and found out how far too late it is to tackle these pests after they have got their big summer start.

"Anyhow," said Freeman, "this is no time to start on chinch bugs. Over in Lincoln Township the farmers are going to go after next year's bugs this fall."

"So am I," said I; though I hadn't thought of it until that moment.

"Good!" said Freeman. "You can get most of 'em that way."

"Um—how would you advise going about it," I asked cautiously—"er—under our conditions?"

"Well," he answered, "there's no use fighting them individually. It's a community proposition. They're going at it on a township scale over in Lincoln."

"So are we," said I—for I'd be darned if I'd admit I was plumb ignorant of the whole business after beginning with a bluff. Not that we didn't both know I'd been bluffing; but he is so young and I'm so old, you see. "Can you come over and help us organize the movement?"

"Sure!" said Freeman. "That's what I'm paid for. And I harbor a bitterness toward chinch bugs that makes me feel a savage joy in such a frolic."

Well, with the help of Tom Whelpley, Frank Wiggins and the leaders among the boys and girls, we did have a frolic—and we cleaned them out for the next year. We raked and burned over all the roadsides, so there were no wintering places for eggs of the bugs. We left no batch of weeds uncut or unburnt. We scourged the swales of matted vegetation as with fire and sword; and gave a shampoo to a lot of lawns and orchards which had not been under the barber's care once in their whole history. We went through groves and hedges with fine-tooth combs; and for two or three days the smokes of our holocausts ascended to heaven like Indian signal fires.

We divided the country into sections of two square miles each, and chose squads, which were scored by a committee composed of Doctor Faville, Jeff Sharpe and Ethel Wyatt Fisher, fifty points each being allowed for speed and efficiency. The best three squads got badges, which we sent off for, to be won three years in succession in order to be permanently possessed. And we had a dance and feast at the schoolhouse when it was all over. We were that much to the good, no matter what the effect on the bugs; but I really think it did a lot of good. The next year we had no chinches to speak of; and they had a good many in sections where no bugging contest was held.

I suppose, too, we destroyed a great many other bad insects, of which we knew nothing. You almost always do better than you expect by being thorough. I reckon the San José scale has been a good thing for the fruit industry; when you spray for scale you rid the orchard of pests of which you never had any suspicion.

Practical Coöperation

THIS started a kind of intimacy between Freeman Clay and me, and gave me a new slant on the county-agent business. I began taking rides with him in his car or mine, in which we pretty well explored the county. I never realized before how ignorant the average farmer is of what is going forward on farms within two hours' run; and I came to believe that we haven't yet really domesticated the automobile as a farm tool. It lays all the farm skill of the countryside under contribution for the farmer who likes to know what the real, practical farmers—not the theorists—are doing.

It began by excursions with Freeman Clay to see what other neighborhoods were doing in the anti-chinch-bug crusade; and I found that he was carrying that war into Africa pretty well all over the county. I calculate that in this thing alone he saved the county several times his salary; for we should never have done it if we hadn't had a county hired man to do the drudgery of dragooning us into it.

Pretty soon, however, he began showing me other things. Before I knew it I had joined with six others to buy bulls coöperatively. You must understand that the bull is just exactly half the herd, so far as improvement is concerned; and, as it is cheaper to buy good blood in one animal than in ten or twenty or forty, he is really a good deal more than half from the practical viewpoint.

"Do you know," said Freeman to me, "how many grand sires are never recognized as such until after they have gone to the block?"

He went on and told me of scores of great cows whose sires had been dead before it became known what great and valuable animals they were. So we organized this bull club to get good animals and keep them, passing them from farm to farm among us until they were aged and tested. Some of these days we'll be found showing the Missourians what's what in breeding—all by the exercise of a little common sense in doing things together instead of separately, and saving on overhead charges all the time.

Since then I have made the same sort of arrangement with breeders of my kind of swine also; and the women and boys are doing the same thing with a bred-to-lay

clear a space for them. So he found himself face to face with Pepita, and the circle closed in behind him. Once again a hush fell on the assemblage. Obviously this was a great moment. For one thing, Pepita was about to speak, and undoubtedly she would say something awfully clever; and then Mr. Manners—well, there was no telling what Mr. Manners might do. The moment was crowded with possibilities.

"Oh, Pepita dear!" chirped his sponsor, fully aware of the importance of her function—it might well be that in days to come she might say "Why, yes; I introduced them to each other"—"I want to present Mr. Manners. Miss Farragut, Mr. Manners."

Their eyes met.

The entire gathering held its breath. Bang!

Alas, not the tiniest pop of a bang! It was rather disappointing.

"Mr. Manners?" said Pepita. "So glad to meet you. You'll pardon my left hand, won't you? Nearest the heart, you know!"

A titter ran its discreet course around the circle. Trust Pepita to say something bright.

"How do you do?" said Billy—not that he cared a whoop, at that.

They shook hands, and Pepita's fingers twined around his own like the tendrils of a vine; and Billy hardened his heart.

"What do you think?" chimed in the mistress of ceremonies. "Mr. Manners is so shy! I caught him trying to run away—now didn't I?"

Billy looked at her coldly, but without rancor. She was too young to die; it was quite out of the question.

"Not running away from poor me, I hope!" said Pepita. "I'm sure, Mr. Manners, I should never wish to drive you away!"—accent on the you.

She flashed the Pepita look at him at one-second intervals. She had found it most effective in the past.

Billy felt that something was expected of him. He was always so conscientious. Without any warning, he came a step nearer and arched his eyebrows. Pepita was startled.

"Oh, Mr. Manners!" she exclaimed; and the circle shivered with anticipatory delight.

"You see," said Billy, "I have never met anyone quite like you before!"

Perfectly true; he never had. He had always managed to avoid doing so before.

"I'm afraid you're making fun of me," said Pepita in a go-on-do-it-again tone of voice.

"Who, me?" said Billy. "I couldn't make fun of you!"

"I don't know about that," said Pepita. "I think you're a dangerous man, Mr. Manners; and I'm afraid of you."

"Don't be afraid!" said Billy, as though he were addressing the last girl in the world. "Let me call you Pepita!"

"From what I've heard about you, I don't believe I ought to—Billy!" she replied very softly, turning from the Prologue to Act I, Scene I.

But Billy missed his cue. He had no intention of going on a conversational joy ride with Pepita.

"May I get you something to eat?" he inquired, and she closed the book of the play of Pepita and Billy with a snap.

Something had gone astray and they were lined up for the Prologue again. Pepita was annoyed.

"If you wouldn't mind," she said, turning away. "I am simply starved, Mr. Manners."

Billy proceeded toward the dining room and provided himself with the first thing that came to his hand. It happened to be a plate of macaroons. It can hardly be said that his heart was in the work.

On the way back he suddenly became aware of a girl sitting in the corner—a jolly-looking sort of girl, prettily dressed and with frank eyes. Billy looked at her once and then promptly retraced his steps to the table. He walked around it once or twice, getting glimpses of her as people came and went between them; then he absently took up a second plate and started off again. It was another plate of macaroons.

This time he looked at her very carefully; and the sight pleased him, for unconsciously he began walking more and more slowly until finally he came to a dead stop before her, with a plate of macaroons wavering precariously in each hand. And then the girl looked straight into his eyes and smiled. Billy was delighted—not because she had smiled at him, though that was pleasant enough, but because the smile reminded him of all sorts of lovable things.

Then very suddenly she tilted her head and began to laugh. Billy came back with a start from some place very far away and realized that he was pouring a cataract of macaroons into her lap.

"Oh, dear!" he exclaimed; and then his laugh answered hers. "H-have some m-macaroons!"

pportunity he retired to the smoking room,
ion to a few bitter thoughts, and surveyed his card: Miss Mortimer, Miss Ashmead, Miss Ferris, Miss Anne Ferris, Miss Gertrude Ferris—grand slam for the Ferris family—Miss Lawrence. . . . Names; nothing but names. He tore the card into little bits and threw them into the fireplace. Young men came and went; but he was a stranger and they paid no attention to him, after the manner of local young men at a dance. There was an outburst of sounds at the front door and Billy understood that Pepita had arrived. Then the music began, and he knew that the first dance was under way and that he was cutting it.

Billy felt very mean. It was only a step for him to feel very sick. He must feel sick. He did feel sick. Must have been those macaroons! In a moment someone would probably come looking for him in the smoking room. He must look sick. He moved over to the window. As he passed the fireplace it annoyed him to see in the mirror how extremely well he was looking. He tried holding his breath to make himself look pale, but he succeeded only in getting very red in the face. He stared gloomily out of the window and heard the applause for the first encore.

The dance was at a hotel and the smoking-room window looked out on a veranda—a deserted veranda, dimly lit by the glow from the ballroom windows. Billy viewed it without interest, except as a possible avenue of escape. And yet the veranda was not actually deserted. In the shadow of one of the pillars a girl was standing, and when Billy opened the window above her she saw him. She said "Oh!" very softly and stood very still in the shadow, watching him.

One is not told what passed through her mind. One can only judge from her actions. In her right hand she held a macaroon—a trifle crumbled, to be sure; and one wonders why she had it with her. She had not brought it to eat, apparently; and, anyway, under her dark cloak she had on a simple but very pretty evening gown, and it is not to be supposed that she had gone without her dinner. She watched Billy for some time without moving. She seemed to be waiting hopefully for something very special to happen. Her eyes were open very wide and she was biting her underlip with the tips of two very small white teeth.

"Mr. Manners is So Shy!
I Caught Him Trying to Run Away—Now Didn't I?"

But nothing happened. Billy just stood there by the window, looking at what he supposed to be the empty veranda. With every moment that passed he felt meaner, and he tried to convince himself he felt sicker. And finally the girl grew tired of waiting.

"Oh, you silly billy!" she observed—but whether she meant Billy in particular or someone else—possibly herself—is not known; then, with a swift little motion, she threw something at the window.

Billy knew nothing until he felt some small object strike his arm and heard it fall to the floor beside him. He looked down and saw the fragments of what had once been a macaroon. For a moment it conveyed nothing to him, though it did seem odd that someone should be throwing macaroons around. Then it occurred to him that it had been thrown from the veranda and presumably at him. Who on earth could be throwing macaroons at him? Good Lord! Who on earth, indeed, but one person! He leaned out of the window.

"Hey!" he exclaimed. "Wh-where are you?" No answer. "Might as well tell me!" he insisted. "Sure to be caught—throwing things around like that!" Still no answer. "Of course you know I can see you perfectly well!" he lied hopefully.

"Oh, no," came a sudden answer in a voice that set Billy smiling. "You can't see me at all now. You're not even looking in the right direction."

"Wait and see!" said Billy. "I'm coming down."

"I'll be gone when you get here," she teased. "It's a long way around."

Ah, but he had no intention of going down by the stairs! It was not a long drop onto the veranda. He put a hand on the sill. "No, you won't," he laughed. "I'm coming now!" And he did.

"Oh, oh!" she exclaimed, stepping out of the shadows. "Aren't you hurt? You couldn't do it again, I expect; but then, it's not necessary, is it?"

"No; it's not necessary," said Billy. "Did you throw that m-macaroon at me?"

"Yes, I believe I did," she replied. "I mean—yes, I know I did. Do you mind? I'm very sorry."

"Are you?" asked Billy.

"Oh, I can't say," she hedged. "I don't believe I have to answer, do I?"

"No, you don't," said Billy. "Why did you?"

"Oh, dear! You ask a great many questions, don't you, Mr. Manners?" she complained.

"I beg your pardon," said Billy. "Please tell me."

"Well," she replied, "I came to see the dance. I couldn't go to it, because—well, never mind why. I don't have to tell you everything, do I? So I came to look through the windows; it's kind of fun. And then I saw you upstairs in the window; and—and I thought perhaps you'd like to talk to me, and—and I threw it."

"I know why you can't go to the dance," laughed Billy. "It's because you tickled your little brother's feet last night, I'll bet! Well, tell me, how did you happen to have it with you?"

"What?" she asked, looking startled.

"The macaroon," said Billy.

"The mac—oh, dear!" she exclaimed. "I didn't think —— You're awfully grown up, Mr. Manners, to ask so many questions. I had it—oh, dear! I'm going now. Good night!"

She turned and ran down the veranda like a little ghost and disappeared around the corner. "Hey! W-wait a minute!" said Billy, and lost valuable seconds before starting in pursuit.

He reached the end of the veranda and caught a glimpse of her flitting across the street, and followed breathlessly, his coat-tails streaming out behind him. She went down the street and turned a corner well ahead of him; but he got there in time to see her run up the steps of a big old-fashioned house set back from the roadway. He stormed after her and heard the front door bang before he was halfway up the path. His pumps clattered on the wooden porch and he hurled himself at the door.

"Say!" he panted. "Let me in! Gosh, let me in!" No answer. "Oh, come," he shouted; "be a sport! You can't run away like that."

Profound silence. He began pounding on the door with his fists. It opened about an inch and he tried to push it farther; but it seemed to be fastened on the inside in some way.

"Please go away!" said a small voice, breathless as his own. "Someone will come if you go on making that noise. I shall be very embarrassed."

He stopped pounding. "Won't you let me in?" he pleaded. "We hadn't half begun to talk." No reply. "You're not sulking, are you?" he asked, hoping for a rise.

oove, a Military Soup Wagon

The price for produce to the producer is fixed by regulation.

The milling of grain, the composition of flour, the composition of bread and the disposition of grain offal are determined by regulation.

The amounts of grain that may be used in the manufacture of alcoholic beverages is limited by order.

The manufacture of industrial products from produce of the soil—such as starch, alcohol, soap—is limited and regulated.

The disposition of livestock is under regulation; so much and such stock is prepared for market, set apart for the dairy, and so on. The slaughtering of animals for food is under central control.

The uses to which milk is put are determined by regulation. The importation and exportation of all foodstuffs and fodders are under central control.

The number of middlemen that may handle a food is limited by order.

The number of wholesalers and retailers that may engage in the sale of foodstuffs and fodders is limited and specified.

The selection of retailer by consumer is under regulation.

The hours of doing business in sale of foods is under control.

The prices that may be charged by wholesalers and retailers, and the numbers of dealers in any line, are matters of regulation.

More Regulations

THE amount of the several foodstuffs that could legally be in one's possession is limited.

The menus that are to be served in restaurants, eating houses and hotels are limited by regulations.

The ration of the entire people is subject to limitation and specification; so much of this and that article of diet a day, week or month, for each infant, child, adult, hard-working laborer, for the sick, and so on.

It is incumbent upon the controller to see that equality is maintained in the food supplies and fodders allotted to the agricultural classes; that waste is eliminated; that transportation is facilitated; that the prices are not elevated by manipulation; that the prices of all foods are kept to the level consistent with the increased cost of production and the increased scale of wages; and that absolute equality in distribution and consumption is attained.

There were metaphysical distinctions between conditional and unconditional confiscation, and limited and unlimited control; for practical purposes the power of the food controller is absolute.

The new system was installed, with the appointment of the food controller, on June 1, 1916. Under this system Germany passed into a state of communism surpassing the visions of Marx and Lasalle. But it was communism from without, not from within. It did not represent altruism; merely repression of commercial interests of individuals and classes under stress of military necessity. Nevertheless, the workings of the system will illustrate to the world how men may be expected to react to the operations of a communistic system of government.

It is interesting to recall that France in 1792–94 passed through an experience quite like that of Germany to-day. The government seized foodstuffs and attempted to regulate amounts, prices, distribution and use upon a socialistic basis. The experiment failed, according to French historians, because of the impossibility of making the producer, the peasant, play square. The German system profited by experience in one direction, and the work of the food controller was classified as executive, and not legislative. The food controller does not have to go to the Reichstag for authorizations. Otherwise each procedure of the Kriegsernährungs-amt—War Nutrition Office—would provoke a struggle between the Agrarian Group and the Social-Democrats—and both know how to filibuster.

One feature of the German regulations that roused much opposition was the control of prices all along the line—in

omen were withdrawn from occupation for
grievous injustice.

lbrück no one knew how much meat, butter,
would be available for sale on a day or within
rds were issued, but the organization was, in
a paper organization. The total value of
, outside the bread card, was that it gave the
holder the right to stand in line for hours and take the chances. During the month of May, 1916, the householder in Berlin who desired any of the following articles had to stand in line for purchase: Meat, sausage, oil, butter, margarine, milk, flour, sugar, coffee, potatoes, eggs and sauerkraut. The results were appalling in loss of time and energy. Rubner made the amusing calculation that the woman who remained in bed for six hours would have more fat than if she stood in line the necessary time to secure the amount allotted on the card.

This state of affairs was particularly onerous for the mother in the family that had no servant. One of the first acts of Von Batocki was to state the principle that no article of food should be announced for sale until the amount available was known; this amount would then be divided into the population pro rata and fixed time for sales abolished. The Social-Democrats charged, week in and out during the Delbrück régime, that the wealthy were permitted to purchase food outside the regulations. Von Batocki promised equality before the food counter, but stated that months would be required to bring it into effect.

A review of the development of the problems that confronted the new food controller resembles a description of a game of hide-and-seek. The producer class desired to consume, convert or dispose of their produce in accordance with their own interests, as in time of peace. The trading class desired to have the distribution to the consumer pass through the ordinary channels of trade and subject to the customary scope of manipulations. The industrial classes demanded that food be furnished to them in adequate amounts and at commensurate prices. The people had been officially advised at the outset of the war that consumption of wheat, meat and fats would have to be restricted; that of rye, potato and sugar increased as equivalent.

When the inventory of grains was taken in the fall of 1915, revealing a total of less than twenty-two million tons as against twenty-seven millions the year before, the fact also came to light that nothing remained of the excess of bread grains of the previous year. Under these circumstances the authorities paid particular attention to the control of wheat and rye, and were able to maintain the allotted bread ration—seven to eight ounces of flour—despite the restrictions of the small crop, but only by the free addition of potato to the bread. During the winter of 1915–16 some fourteen hundred thousand tons of grains were imported from Rumania, half of which were bread grains. Efficient management in the army effected a saving of some two hundred thousand tons; so that, with the addition of those two amounts, the bread grains available for the year 1915–16 lacked only three hundred thousand tons of the crop of the previous year.

A calculation on the basis of bread-card and flour allotments, including the heavy bread ration of the army, indicated that a million bushels remained as reserve. The importance of this reserve became apparent in the spring of 1916, when the scarcity of potatoes and sugar made an increase in the bread ration highly desirable. The reserve, as in the previous year, had largely disappeared; and, though it was possible to enlarge the bread ration to certain groups of workmen in industrial districts, the fact remained that a million tons of bread grains had again disappeared.

Bread Grains Fed to Cattle

THE statement of the Social-Democratic Party, made in the Reichstag, to the effect that eight million tons of bread grains had been deflected from food to stock feed, was an exaggeration; but there is apparently no doubt that, in all, between three and four million tons were thus diverted within two years. As time passed the unfortunate results of the original establishment of the bread ration have become more and more apparent. Had the flour ration, as flour and bread, been set at the outset at nine-tenths of a pound, where it should have been established, that ration could have been maintained, since the control would have been elaborated to that end. Then, when other articles of food became scarce, the deprivations would have been less severely felt.

The crop of wheat and rye of 1916 was larger than that of the previous year, equaling that of 1914—over fourteen million tons. As soon as this was assured the food controller announced an added ration of one ounce and eight-tenths of flour for children between the ages of twelve and seventeen, increase in the bread ration to nine-tenths of a pound for all manual laborers, and to one pound and

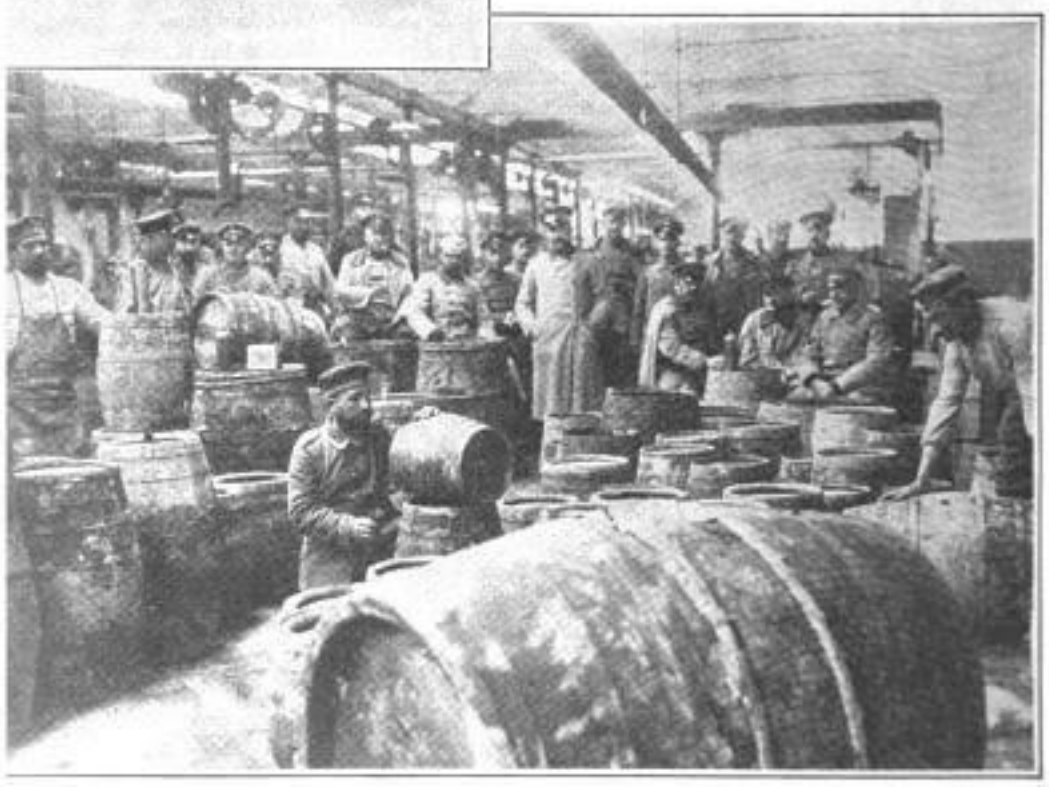
Kitchen waste and table scraps are subject to collection in cities of over forty thousand inhabitants; and special wagons are provided for this purpose. The collected materials are dried and pressed into cakes and then delivered to communal authorities, who allot them as fodder for milch cows. It has been estimated that the per-capita waste thus saved amounts to over one ounce a day, and that the milk derived therefrom was equal to a million quarts a day. Animal waste matter has been utilized to the practical exclusion of all loss. Slaughterhouse refuse, bones, bodies of dead animals—including bodies of animals killed in the war zone—fish and mussels are dried, pressed and used as fodder, alone or with carbohydrates. Such materials used to go to the soil as fertilizers; to feed them directly means saving time. The control of sale and use of feeding stuffs and fodders of all kinds is now under the charge of the Feeding Permission Bureau, which determines how, where and to what extent livestock shall be fed.

The Pig-Fattening Company

OPERATING in connection with this bureau is the Pig-Fattening Company, which directly or through communals contracts with swine or cattle owners to send to them feeding stuffs against agreements to return certain numbers of fattened animals of specified weight within a stated time. These arrangements, of which the large cities have made especial use, have worked out to the satisfaction of all concerned. The risk is taken from the feeder, capital is advanced to him and the result cannot be deflected. It would have been better had the state in the beginning confiscated all fodder, feeding stuffs and livestock, reduced the latter to the plane of the former, and fattened them, by contract with the peasant, with the confiscated feeding stuffs. It would have been better to pay the peasant his price rather than to lose the units of human food; if a guard had been placed upon every farm in Germany he would have saved much more than his board and wage.



When the small sugar-beet crop of 1915 came to the refineries these were practically empty of the huge crop of 1914. The exact sugar crop of 1915 was not then announced, beyond the statement that it was about two-thirds of the crop of the previous year. It was later announced as fifteen hundred thousand tons. This should have sufficed to cover the normal consumption of sugar plus the excessive demands of the army. There was paper regulation of sugar during the winter of 1915–16, despite which the peasants fed beets freely, and also molasses; and the consumption by distilleries was probably in excess of the normal.

In January, 1916, sugar had become very scarce. Then the feeding of beets and molasses to livestock was prohibited and the recovery of the sugar from molasses again permitted. Sugar cards appeared in March as local regulations, the allotment was not guaranteed, maximum prices could not be maintained, and during the spring and summer months sugar spelled confusion.

A survey of household consumption indicated that this had been abnormal. The authorities had evidently calculated that the people would consume the usual

If he had ever had any ambition to y life of a sea captain, it would have been this prolonged observation of the morass in er had become involved. If there was such t terrors Craigenside experienced their bitull.

once I wondered why he didn't weigh anchor n the Asphodel," said Joe, "but this trouries under his own hat, I suppose. At any uld have stuck closer to a house than he did

e night of the fracas in the Glade. This was ge happenings, Joe averred. First, along clock the young lady, who was usually as b and much more self-possessed than her hing up the terraces like a mad woman with ed and her cheeks as pale as death. She dard without a word and stood leaning a that cast-iron dog on the lawn, and looking e river with heaving breast.

Fascinated, Goddard crept up on her, and for an instant, before she turned away from him and ran into the house, he saw the expression on her pale face. Her jaw with its delicate squareness was set, her dark eyes expressed a fiery resolution; but beyond this they were full of a supreme happiness, which seemed to communicate itself to every atom of her body. This transfiguration was so strong that even the rough seaman could not fail to note it.

He stood there wondering in the darkness, and then it occurred to him that if he was to inhale the true savor of this thing it must be through the medium of tobacco. He searched his pockets in vain, and at last remembered that he had left his pouch on a spile at the wharf's end.

He had heard nothing of the captain on this evening; he felt certain that he must be asleep. Whether asleep or no, the pull of the tobacco pouch was too strong to be resisted. Down he went, as speedily as his bow-legged gait would warrant. He snatched the pouch from its spile, filled and lit his pipe, and began to reascend the terraces at a more contented pace.

Then when he was about level with the second terrace he heard behind the rose bushes there the noise of some sort of scramble. There was a hollow sound, as if a man's ribs had been severely thumped; then a more ominous sound yet, as if a skull had been splintered by some sort of bludgeon.

Joe Goddard snatched his pipe from his mouth and rushed forward, only in time to see Captain Ruel stretched his length on the turf, and a rill of blood sprawling on his cheek. He stood aghast, but before he could collect his wits to look about him for this mysterious night assailant he received himself from behind a crashing blow on the head which tumbled him senseless across Ruel's body. When he opened his eyes Craigenside was standing over him, staring at his hand, which was crimson with blood where he had put it to his head.

"What's all this?" he said in a dazed way. "What's gone on here, Goddard?"

"We've been knocked out by some sort of thug or other," said his watchman. "Did you get a glimpse of him, I wonder?"

Ruel shook his head stupidly; then struck by a sudden thought and with a frightened oath, he wheeled in his tracks and began lumbering toward the house. Goddard, staggering after him, was in time to see him snatch open the lid of the clock, mutter "Gone!" in an agonized voice, and sink to his knees in a kind of lethargy. As to what might be gone, Goddard did not know; he had never monkeyed with the clock itself.

Hawley and I were not so much at a loss.

"It looks as if the jig was up," I said. "The man has got what he wants; he must be off by this time."

"Not so sure," said the little man. "We do not know yet into whose possession the jade actually came. We do not know who delivered these two very skillful blows."

"Who if not the ornithologist?"

"Assuming that he had a living assistant, that man must have had an interest in the thing. Otherwise why should he have tried to murder him?"

"Have tried ——"

"We have no proof of actual murder."

My brain reeled.

"Neither have we proof of an actual victim," I reminded him.

He acquiesced.

"We have first to construct a man; we have next to contrive his escape from the power of this mesmerist. But, assuming the criminality of Smith, this is certainly one of the possibilities; and if we do not assume his criminality we might as well give over effort at once."

Turning to Goddard, who had stood listening in a puzzled way, he said curtly:

"Did you see the young lady again that night?"

"In about ten minutes she came by again, and there was Captain Craigenside standing beside that cast-iron dog with blood on his cheek and his eyes bulging out of his head. It was just after his looking into that clock for something that wasn't there. But she seemed to take no notice of him at all, but into the house with her and up the stairs at one bound."

"Did she retire then?"

"No, sir, she was on the roof of the house with her uncle's glass for a good hour. Then down she came, and said to me she was going over to spell the girl with the old lady."

"You did not attempt to follow her, I suppose?"

"I was too sick and sore," replied Goddard. "I had all I could do to hang onto my head."

"So that you do not know whether the young lady actually did as she said she was going to?"

"Well, now, I think I do. For the next day I says to the Crooker girl: 'You look peaked. Were you sitting up all night with the old lady?'

"'No,' says she; 'I was spelled at the usual hour by the young lady.'"

"And what time did she come back?"

"Along sun-up. She was as fresh as a daisy then, and came along singing. That's the first time I've heard that girl sing, too, to my knowledge."

"She was happy," said Hawley reflectively. "Now what an odd circumstance, gentlemen, was that! You will agree with me that the sight of her uncle, bathed in his own blood and half demented by the approach of some creeping horror, could not have been the cause of this singing; nor is the bedside of a dying woman usually a cause of cheerful reflection. Yet after such a night she sings—she sings. Not out of sheer callousness or indifference surely."

"And you?"

"That is a horse of another color," said the little man. "I shall be busy on my own hook, never fear. As the lawyers say, I shall be off on a little frolic of my own."

He drew me aside and said in a whisper:

"Watch for the ebb."

There was still sunlight left when Hawley departed. To calm my mind and bring it out of its confusion, I took oars and went up the river in a little punt belonging to Sturgis.

What strangeness there was in all this business! It seemed certain that there was a connection between the disappearance of that scarlet puppet and the secret history of the Craigensides; and what could this connecting link be if not the god which had been stolen from the shelf in that upright teak-wood coffin? But if that was it, then vengeance had been consummated; and what likelihood was there that the criminal still lingered in this neighborhood? I for my part had privately made up my mind that I should never again in this life clap eyes on Mr. James Smith. He had gone as he had come, without fuss or feathers, perhaps into the sea, perhaps transmuted into one of those whirling sand devils which fled
vanishing troops. Whether

"Do we any of us want to go?"

"Still, where she has lived her life, a man would think she would know enough not to train on as she does. But, dear me, my girl Amanda has waited on her by inches for the past week; and quite often she is out of her head, the old lady, and no sooner is she out of her head than she dreams she is in hell."

"In hell?"

"Yes, sir, with the flames scorching her. Did ever you hear of that? Calling out 'Water! water!' and squirming on the bed like all possessed. She's a strong Methodist, too, strong Methodist to appearance. But now if I was to bet with you about that old lady ——"

He narrowed his eyes. "It's God's truth she and old Amos had some league with the devil. Yes, sir. It would come natural to him; and she was that kind, that she would follow where he led. She wasn't in them Eastern oceans all her life for nothing."

I laughed, knowing this to be normally a spur to Dave's imagination.

He shook his head and rasped his hands together.

"You kin laugh," he said, "but my daughter will tell you that it ain't no laughing matter. She has heard her talking to the devil himself this last day or so, and if it wasn't that she was a mighty sensible, strong-minded kind—she's like her father, takes an interest in things and the like of that, but ain't to be frightened—she'd have fled the house long before this."

"And why?"

"Maybe you ain't heard about the old lady's closet demon," suggested Dave.

The closet demon!

"Explain this thing," I said.

"There ain't nothing that can be explained," Dave answered. "But there's an imp from hell joggling her elbow the moment my daughter's back is turned. She can't be left alone a second."

"And what like is this imp?"

"That's more than I can tell you," said Dave gloomily. "It's not of this world, but still it has a mortal hunger for the old lady's soul."

"And it is this demon which is tormenting the old lady?"

"There ain't a doubt of it. The thing keeps dragging and dragging at her, and won't take 'No' for an answer. She'll go with the ebb."

Dave stood up with his weir net over his shoulder.

"I'm heading for the dunes," he said. "Will you put along with me?"

We began to go toward the sea together. The sun had left the water by that time, but the gulls flashed light as they glided in the upper air, which held a mellowness of last rays. The wind fell away to nothing, and in the stillness we heard the sea droning on the coast. The dunes were like crouching yellow hounds awaiting whatever prey destiny might waft them from that wide horizon. More dazzling and more unstable than the imagination of man itself, they were not the same two days together. They rippled, crawled, billowed, uncovering here and burying there. At no great distance from the tomb of the Craigensides the bones of some old ship had come to light, a file of charred rib ends protruding black as ink into the swimming golden lights of the western ridges.

"Look how the sand has sucked her old skeleton in," said Dave.

The great net was draped over his crooked shoulder, corks dragged at his heels over the yielding sands. He looked himself like a sea wraith born of that shipwreck; and I was following him, smiling a little at the figure he presented, when suddenly he came to a full stop opposite the tomb itself.

This had been cut into a solid rock ledge, at the extreme limit of sand. It was a desolate little place. Granite pillars had been set at intervals round it, linked together by sagging chains which had grown very rusty. At the base of the tomb some sort of tiny flower grew in clusters, and the iron gate had wrought into its pattern a scheme of lyres and weeping willows, much bitten by time and sea salt and driving sand.

Now a strange thing: The little fisherman at my side stared and then bent down with a convulsive movement, his nose all but thrust into the sand.

"Come here, boy, come here," he said in a throaty whisper.

The golden coloring had left all those floating wisps of cloud; the dunes lay cold and ashen in a sinking light; and coming up behind my little fisherman I saw with beating heart the thing he pointed out. We were not twenty feet from the front face of that old rock tomb, and there in a patch of firm sand the tracks of a naked foot were sunk deep.

I sank to my knees. Beyond all question I had under my eye the track of a man with six toes on his right foot. I sprang up and stood staring at the rusty door and the purple flowers all about it, and scarcely felt old Crooker twitching my sleeve.

"Let's put her for home," he muttered. "Let's put her for home, boy."

"Wait," I said. "There may be nothing mysterious about this."

"Look there at the six toes. Man alive, it's no one else!"

"Offshore," he said briefly.

"So you said before," I answered him tersely; "but one of your rockets went through the theater roof notwithstanding."

"That will not happen again. We have set these sticks up at a different angle this time—about eighty degrees. They will all land in the river."

"Make sure they do," I replied. "The first rocket is to go off the moment the five arcs come on under the theater roof. Then wait five minutes and go on with your exhibition."

I left the powder monkey grinning, and went back on the gate. At some time during the second act Doctor Starr put into my hand a bottle wrapped in pink paper.

"Here you are," he said. "The girl will know how to give it."

I pocketed the bottle.

"Any time before midnight then."

He was gone.

I felt that there was no time to lose. I held a deep-seated conviction that some part of this mystery lay locked in that old lady's dying brain. Accordingly I got my colleague on the gate and crossed the river.

Making my boat fast to the Craigenside pier I skirted the lowest terrace, leaped the stone wall, and found myself in Mercy Cobb's estate.

Mercy's house lay to the left of the Craigenside estate. It was far older than the larger place. Long, low and broken-backed, it seemed as if several ripples had been sent through it, like those which attend movement on the part of a caterpillar. Seaweed had been banked all round its foundation the winter before for the warmth, and this rampart, though shriveled and blackened, had never been removed, and straggled away from the house like locks of the dead Medusa. The windows were full of small, wrinkled panes, and the unpainted shingles, dislodged in places, glowed wan silver under the flying moon as I stepped into the yard. It was like an old gray hen that had begun to molt.

Delicate pilasters were set into the body of the house at the front door, supporting the fan-shaped glass transom over it. Into the worn granite flag which served for a step an iron scraper had been sunk and leaded, and on the ground at either side lay vertebræ of giant blackfish bleached marble-white and very porous. The wind that eddied there bearing the strong odor of the flats, testified that already, as I pulled the bell, the tide was running hard.

A sleepy girl, of nineteen or so, with red eyes and flaxen hair, let me into the hall. This was the daughter of the fisherman.

"I've brought the medicine," I said, and handed her the bottle.

She was a tall, broad-shoulderd girl with tousled yellow hair and kindly eyes red from lack of sleep.

"I'm thankful you've come," she breathed, half sobbing. "I've been thinking she might go any minute, and me here all sole alone with her."

"Is there nobody to relieve you?"

"Miss Craigenside was here earlier, but the captain sent for her."

"How is the patient?"

"She couldn't well be worse. Oh, Lordy, I hope I never live to grow old and carry on as she does. It's just wicked that that good old soul should be made to bear it in her last days. It doesn't seem right. Oh, I do sincerely hope I may die young, sooner than come to this."

"She has requested to see me."

"Then come this way, please."

The house had a faint, not unpleasant smell of must, interpenetrated by the odor of straw matting. A week's dust lay about, but otherwise the place was neat as waxwork. Not a rug was turned, not a chair out of its appointed place. Faded pictures in tarnished gilt frames hung against wall paper that had wrinkled and blistered in the corners, and the design of which was of a very ancient date. The stairs and banisters creaked and snapped as I followed my guide upstairs. A hand lamp stood burning dimly on the top step. In another moment I had entered the room, and stood looking down at all that was left of the earthly tenement of Mercy Cobb.

The indomitable old lady presented an extraordinary spectacle. She was propped up in the huge four-poster, her meager body covered by a sunflower quilt, one of these affairs of a thousand pieces, to which such women devote I hesitate to think how much of their lives.

"Ah, you are there," she said feebly. "Sit down, my good young man."

Her black eye held craft and entreaty in it.

I drew near a blue-painted wooden chair, on the back of which a red robin was roughly indicated. She regarded me with burning eyes, clutching the quilt to her chin, the witchlike outthrust of which sickness had exaggerated. And this movement of the quilt revealed, what I would rather not have seen, a great lump of glistening blue clay at the foot of the bed, in which her feet were buried. The angel of death, it seemed, touched her cold by horrible degrees.

"I'm going with the ebb, as I said I should," she whispered, closing her eyes. "Have you seen the captain?"

"Not to-day."

"Ah, he's up to some deviltry. He called the girl from 'an old lady's deathbed. I never liked that man from first to last. Not from first to last. He's no more like his father than chalk is like cheese."

The girl came in with the medicine in a graduated glass. Old Mercy clutched it in a trembling hand.

Food and Frightfulness

THERE have been many contradictory reports about food conditions in Germany, and in palliation of the ruthless acts of the Central Powers their sympathizers have claimed that women and children are being starved to death. The results of Doctor Taylor's six months' scientific inquiry into the control of food supplies in Germany, now being published in THE SATURDAY EVENING POST, seem to establish conclusively that up to the last of the year, at least, Germany, while it had had to tighten its belt, was not starving or threatened with starvation.

That the German nation as a whole is living on short rations, and rather uninviting rations, appears to be the fact; but that any condition approaching actual starvation exists in any class is not true. Germany cannot plead that extenuation for lawlessness and ruthlessness.

Precedents

THERE are two broadly typical ways of looking at a precedent. The conservative way is to say: "This institution, or policy, or custom, has endured so many generations; therefore, it must be the final embodiment of human wisdom, and we should be bound by it." The radical way is to say: "This thing has stood here a hundred years; therefore, let's give it a kick in the ribs to find out whether it's still alive, or only a mummy."

Taking it by and large, the radical way, of course, is the more intelligent—especially in politics; for if any political arrangement was good a hundred years ago the rational presumption would be that it is not good now. Step into a museum and notice how little of the stuff that was used a hundred years ago would be useful now. For one illustration: Nobody knows better than constitutional lawyers and Federal judges how the Constitution of the United States has undergone constant modification from the day it was adopted, until its framers would hardly recognize it now.

Recently they have been quoting Washington and Jefferson and Monroe on every problem that has come before them. Quoting Confucius would be almost as much to the point. Washington and Jefferson, at least, were not blockheads. They did not derive their policy from the precepts of Solon, but from the situation of America and Europe as it was in their day.

What somebody else had thought on the subject under the different conditions of a century before would have interested them little. They had recently been engaged in a very extensive smashing of precedents.

Work for a New Solon

IN HIS last sane years Nietzsche projected a great book which he was never able to write. His notes indicate something of what he had in mind. One of them reads:

"Third Book: The problem of the legislator. To bind anew the unregulated forces in such a manner that they are not mutually annihilated by running foul of one another; to make a real augmentation of force."

Doubtless he did not mean a League to Enforce Peace, for he held that a truly useful state must engage in vigorous to be remedied by shooting off the male population's legs, thereby reducing them to a state of sobriety which would relish philosophy.

All the same—especially in view of what has been happening during the last two and a half years—that note suggests an enormous task for the statesman: "to bind anew the unregulated forces in such a manner that they are not mutually annihilated by running foul of one another." Even in the peaceful United States a large part of the country's potential force does cancel itself by mutual jealousies and antagonisms. Better coöperation is the greatest problem before the world.

Statecraft

THE Bryce report on Armenian horrors is possibly subject to a certain discount, because the atmosphere of war is not conducive to judicial poise. Making all reasonable allowance for that, it still seems clear that some hundreds of thousands of Armenians were murdered by the Turks in 1915 and 1916, with all the beastly circumstances of Genghis Khan and Tamburlaine. Children were brained and drowned wholesale, and the highest good fortune for a woman was to find some means of committing suicide before falling into Turkish hands.

The hundreds of thousands of Armenian men, women and children who were killed with appalling cruelty during the last two years were really victims of Europe's international system. They were among its logical fruits. The civilized states were so completely occupied in jealously watching one another, and patching up a wabbly balance of power, that the Turk practically had a free hand. The civilized power of Europe simply canceled itself in mutual distrust and hostility.

We may be absolutely sure that the old system will produce the old results. Under it, a generation hence—if the Christian subjects of Turkey have not been quite exterminated—we shall be reading of more Armenian outrages. The only remedy is a new international relationship.

Advertising the Library

SEATTLE sends us a set of attractive placards that are well suited to making citizens aware of their public library. One of them reads: "Get the good out of your Public Library! Borrow the brains of the best writers in your line of work. For information on any subject, try the Reference Department, Main 2466." Another says: "When you want information, statistics or facts, don't hesitate; come to your Public Library or telephone. This service is yours for the asking." Another reminds the Seattle parent that "Your child's reading may bring happiness, success, character. If you want to know what books are worth while for boys and girls, go to your Public Library; ask the Children's Librarian."

Skilled workmen and those who wish technical information are reminded that the latest and best books are to be found at the library: "Go to the Technology Room and ask for Mr. Thompson, who will be glad to assist you."

This is real public-library service. Broadcast messages of that sort, in striking and attractive type, will multiply a library's usefulness.

Every day's mail shows us how much public libraries need to be advertised. Follow Seattle's example in inculcating a public-library habit.

A Real-Estate Note

THE world is going up!

A hundred and fourteen years ago we bought from France nearly a million square miles of territory, containing great areas of agricultural land as rich as any on the globe, all in a temperate climate and abutting on a great highway to the world's markets. The purchase price was approximately fifteen million dollars, or only a few cents an acre.

Fifty years ago we bought from Russia nearly six hundred thousand square miles of remote and rugged territory, just under the Arctic Circle, having little known productive power. The price was seven million two hundred thousand dollars—a great advance over the Louisiana Purchase, considering the difference in the land.

The other day we bought from Denmark a handful of rocks in the Caribbean and paid twenty-five million dollars for them.

This overmatches any story of city real-estate boom that we know. The world is going up!

No farther back than the eighteenth century great parts of the earth's surface were like land, say, in Nebraska in the early seventies. A farmer with a homestead claim and a timber claim, and illimitable reaches of scantily settled country all round him, might swap a horse for somebody resources into the competition.

A Hopeful Sign

CONGRESS, it seems, has some interest in the subject of economy. The Senate proposes asking the President to investigate the executive departments, somewhat on the lines of the Taft Efficiency Commission, and report next winter whether they cannot be reorganized to advantage. Several senators expressed an opinion that thirty or forty million dollars yearly might be saved in that way.

This is a hopeful sign. That at least thirty million dollars a year can be saved, and public business more efficiently handled, by an intelligent overhauling of the executive departments is highly probable.

But the great waste is up at the other end of Pennsylvania Avenue. If Congress once gets interested in this subject of economy there is hope that it will finally overhaul its own end—with a real budget system, a comprehensive and permanent plan for river-and-harbor and building appropriations, and so on. We should like to assure Congress that a great number of people have long been interested in governmental economy, and that every sign of interest on its part will be popular.

Waste

SECRETARY REDFIELD recently confessed to having a "suspicion" that the country's total cartage bill might be five or even ten times the total freight bill. The secretary may be too suspicious; but unquestionably, on a great part of the goods consumed in the United States that are transported both by rail and wagon, the cartage cost is much more than the freight cost.

This is because transportation by rail is highly organized and transportation by wagon is hardly organized at all. In every city, and almost every town, at every hour of the day, wagons are running over substantially the same routes, so that two or three, or half a dozen, are performing a service which one could perform just as well.

That is the way in which the United States is really wasteful—in lack of teamwork and intelligent comprehensive planning. In many other ways it is blamed for waste that is more an appearance than a reality. It wastes many substances because to conserve them would be a waste of human energy.

If a carpenter's time costs forty cents an hour it is cheaper to let him throw away thirty cents' worth of board ends than to spend an hour in carefully matching them together. To make it worth while to save the board ends we should have to pay him only twenty cents an hour. We waste the boards, but save the carpenter.

A farmer who cannot, sometime in nine open months, waste half a day taking his family to a picnic in his own wasteful automobile is himself largely wasted. We do not want life so ordered that nobody can throw anything away.

It is the waste of bad organization that needs curing.

A Revenue Reform

AFTER three years of experience the income tax is open to question. Returns for 1916 emphasize this.

Some seventy million dollars of easily got revenue is derived from it; but every study of the returns strengthens a suspicion that a good deal of taxable income escapes.

The fault is not at all that a small part of the country pays a great part of the tax. In 1916 fifteen districts, inconsiderable in area, but comprising the chief wealth centers of the East and Middle West, paid five-sixths of the total tax. But if they have the income they ought to pay the tax.

The real cause for dissatisfaction arises from a presumption that a great deal of taxable income in the lower ranges of taxable income escapes. After three years' experience the Collector of Internal Revenue says "It is axiomatic that the Government cannot rely entirely upon a taxpayer's declaration as to his own tax liability."

The tax ought to be enforced as equally as possible or it ought to be abandoned. The Prussian method of enforcing an income tax is vexatious; but it is better than a general presumption that the man who does declare his income honestly is paying taxes for his neighbor whose conscience is more accommodating. The Prussian method involves keeping an official eye upon every man's expenditure—the sort of house he lives in, whether he has an automobile, and so on—and calling him in for a rigid cross-examination if the income he reports for taxation seems inadequate for his style of living.

As a beginning—and whether or not the exemption is lowered—the Government should require a statement of income from everybody in receipt, say, of fifteen hundred dollars a year or more. That foundation would facilitate checking up evasions.

ıg to pay my ound to keep up nily," he said. udest symbol. ymbol. Do you

suppose you could have raised such a volunteer army as we have—an army so large in proportion to your population? The prestige of Kitchener had something to do with it; but mostly the King. 'Your King Needs You!' was the phrase that brought the volunteers!"

I mention these instances because they are typical of a thousand others. Here and there I found a man who whispered—gently whispered—that the institution of monarchy had worn itself out. But these were rare. One such was a Socialist leader.

"Nevertheless," he added in qualification, "it isn't nearly so bad as some other things we have to correct in these islands; and I'm afraid Humpty Dumpty will be the last figure to come off the stone wall."

Yet an American understands all this, with his mind, though not with his emotions, if he compares their symbol with ours. We have the flag, merely a combination of primitive, inartistic forms and colors printed on cloth. We may criticize the design; without being unpatriotic, we may say of any given flag that it is blazoned in cheap dyes on rotten fabric. Yet he who publicly insults the flag gets arrested, and he who tramples upon it stands in danger of the mob. It is our symbol. Now, instead of a flag as a symbol, imagine a human being with flesh, blood, animal warmth and personal peculiarities. Imagine, also, that the symbol is surrounded by beautiful, antique appurtenances of pomp; that it is kept in palaces such as appeal to national or local pride; that every great government honor is conferred in its name.

By holding the symbolism of the flag in mind we shall arrive, I think, at some sympathetic understanding of the British attitude toward royalty.

So we can make a key to this door; but presently, exploring further the British House of Thought, we come to another, which we cannot unlock, a state of mind for which most of us have no means of sympathetic understanding. It is the class system, and the British attitude thereto. This, the dyed-in-the-wool American can regard only externally, looking upon it as a man looks upon such a phenomenon as the migration of birds or a blood stampede in a herd of cattle—the activity of a totally alien mind, whose expressions and manifestations he may note, but whose true, deep motives he cannot understand.

We encounter it even among the people with whom, on most points, we have the greatest mental kinship. A young American woman of intelligence and ideas was making her first visit to England. She met an English lady, with a minor title, who held advanced social and political views. Together, as kindred spirits, they used to knock about among the radical and revolutionary meetings so common in London, and usually so interesting. At last they attended a dinner given by a group of workingmen to the popular hero of the hour. The toastmaster, in his preliminary remarks, said something like this:

The Prayer Book Taken Literally

"WE ARE glad to honor one who has been honored by so many of the higher classes."

The American girl whispered to her companion:

"Heavens! I thought that here, at least, we should escape from this cant about class."

The English girl turned upon her a blank face.

"My dear," she said, "you must remember that the class system was arranged by a power higher than we!"

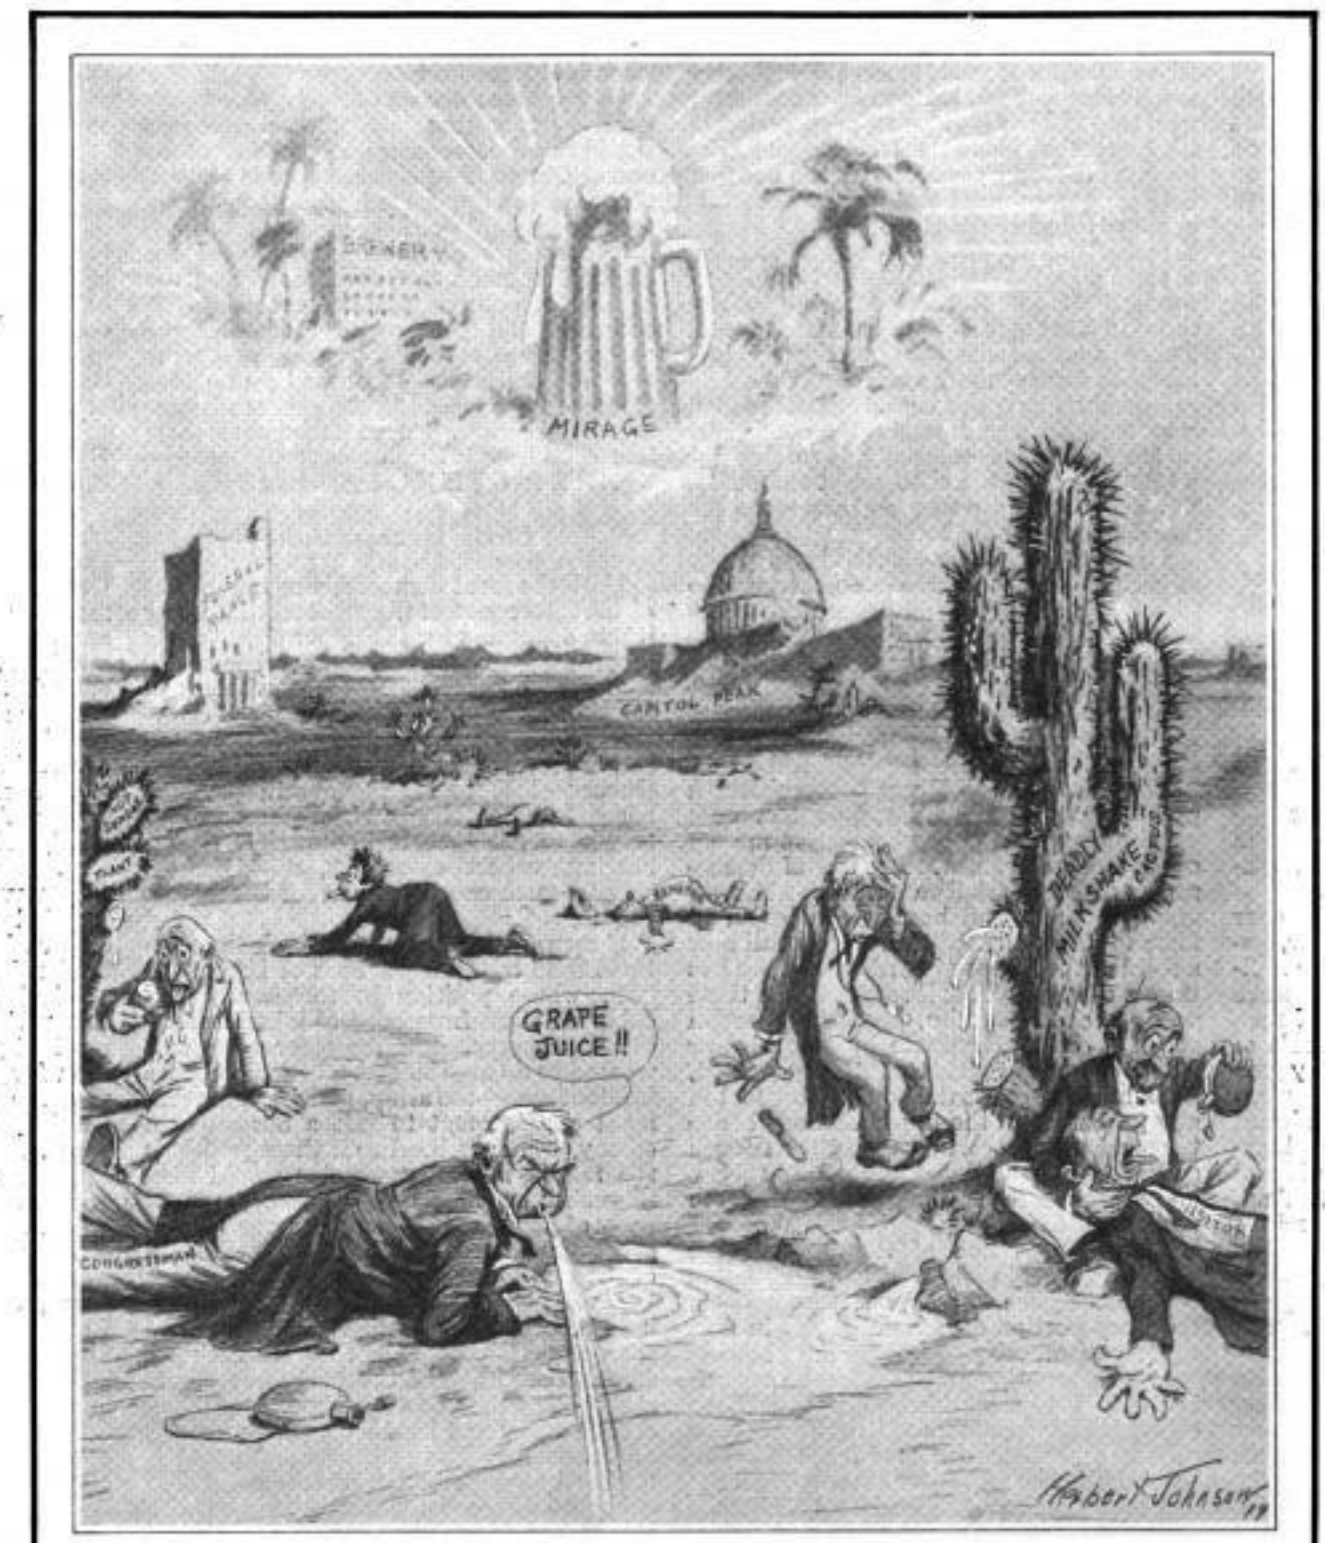
The lady was expressing a tenet of her church. There it stands in the catechism of the Church of England:

"*Q.* What is thy duty toward thy neighbor? *A.* To order myself lowly and reverently toward all my betters . . . and to do my duty in the state of life into which it shall please God to call me."

Similar words are in the prayer book of our Protestant Episcopal Church in America; but we do not interpret them literally. The conservative English, I take it, do.

I was talking last autumn with a British economist and Fabian Socialist, a great, quiet force in England. He was forecasting for me that newer England which British liberalism hopes to bring about after the war—its organization for social justice, its abolition of old forms.

"And what you call the class system," I ventured—"will that go too? Will you abolish your government by class?"



A change came over his face. I had run into the invisible wall.

"We believe," he said, "that the best people should rule. In county elections we delight to think that our candidate is a man of education and comes from the finest families. That is the wisest way—don't you think?"

And he said it with such sincerity, with such deep, basic conviction, that I had the heart to register no more than a mouselike difference of opinion.

To give still another typical example: I had written something in praise of the democratic spirit in the French Army. An Englishman took me to task for this article, alleging that the British Army was also perfectly democratic, and should have been mentioned along with the French.

"Why," he said, "the spirit is perfect! The men love their officers."

Death in the Desert

Digitized by Google

and, I think, especially strong in the Northern races, from which we ourselves have drawn most of our blood. We Americans have no sooner got a new mining camp into working order than it begins to develop "the best people." What are our fraternities in the Western and small Eastern colleges; our class societies at Yale and Harvard; our clubs at Princeton—but artificial reachings toward an upper class? We have in the older cities of the Atlantic Coast an aristocracy almost as insistent on exclusiveness, almost as convinced of the righteousness in class, as the oldest aristocracies of Europe.

But—and herein we differ from the British—the people below these exalted beings do not recognize their claims. To a very great extent the lower classes of the British do. "I am as good as any man alive!" says the American mechanic. Tell him that he isn't a gentleman and he will knock you down. "I am of the lower class," an English workingman will say, with neither pride nor humbleness, but as one stating a fact. Tell him that he is not a gentleman, and he will reply "Of course not!"

In short, the average conservative Englishman accepts the social position into which he was born, be it upper class, upper middle class, or lower class, as he accepts his stature, the color of his eyes, the shape of his nose. The average American or Frenchman accepts class only if he happens to be of the upper class.

Once, in a town of Central France, I witnessed an interview between an old French peasant farmer and a count, whose family, under the old régime, were lords of the High Justice, the Middle and the Low in all that region. They held adjoining tracts of land; the interview had to do with some emergency war measure. The peasant entered the presence of the aristocrat with an easy dignity that had in it neither deference nor impudence. He was just one Frenchman talking to another, with the same politeness he would have shown to any comparative stranger of his own class—no more; no less. The British small farmer, thrust so into the presence of the lord, would have entered fumbling his cap and ducking. The Frenchman, risen to eminence from humble occupation, absorbs the manners of the class into which he has been graduated. The average Englishman, in like circumstances, carries with him to the last of his days the marks of his origin. He usually shows an uneasy consciousness that he is not quite a gentleman.

The Operation of Class

The operation of class in Great Britain has so many lights and shades, so many subtleties, that an alien must needs live in England for twenty years in order to get all its bearings and ramifications. I, who write of it here, profess to give only a superficial view, like that of the Englishman who polishes off Chicago after a month's observation. Yet, having seen a few of the workings of class in politics, in the army and in commerce, I can perhaps write of it truthfully and soundly along broad lines.

One who cast an observing eye over England in the early days of the war, before all its manhood was cast into the military melting pot, could not fail to observe a difference in the physical build of men and officers. At the time, the old rule of British Army organization held pretty generally true—the officers were gentlemen; the ranks were lower class. And, almost without exception, the officers were long-limbed, slender, willowy—the kind of build we associate with a distance runner. And, almost without exception, the rank and file were stocky and beefy—the John Bull build. As the first volunteer regiments came into khaki one noticed a change in the appearance of the rank and file. The distance-runner build began to appear among them also. This, you found after a little investigation, was because the upper class, true to their traditions, had been first to volunteer. I spoke of this to an English friend, who added his testimony.

"I stood in the lobby of the Houses of Parliament last week," he said, "when the House of Commons and the House of Lords adjourned at the same time and came

teristic; and the Normans were a Scandinavian people. The stocky build is a Saxon characteristic, apparent to this day in the people of Saxony. In short, one began to suspect that among the South British, whom we call the English, there were still two peoples, dwelling side by side—and I wondered whether Norman and Anglo-Saxon had yet really fused.

Why was it? William conquered England, bringing with him his Norman lords, retainers and settlers, in 1066; within two or three centuries, the history books tell us, the amalgamation of the two peoples was complete. Though Norman blood remained the boast of the oldest nobility, that strain, in the law of breeding, must have flowed through much of the English people, as a drop of actual blood in a pail of water will spread at once and color the whole mixture. Dr. David Starr Jordan has said that almost every person of pure English blood would be found, could we but follow up his ancestry, to be a descendant of William the Conqueror.

However, a special tendency, newly discovered but universally recognized, governs breeding—what science called the Mendelian law. We know now that there is such a thing as a dominant strain. One parent, or one race of parents, is, in the function of breeding, stronger than the other. This tends to put its imprint upon the race that arises from the mixture.

The Dominant Norman Strain

Now I miss my guess if the Normans, those wild, vigorous, long-limbed, hard-hitting rovers who adventured all over Europe in the dawn after the Dark Ages, did not constitute one of these dominant strains. A tribe of them settled on the River Don, in Russia, marrying with Slav and Tartar women, taking Slav and Tartar men into the tribe—a small part, really, of the blood that made the Don Cossack. Yet to-day the Don Cossack bears the mark of the Norman in mind and body. The Normandy of France holds still, in spite of centuries of marriage with Frank and Latin, a population of tall, blue-eyed men and women. If the Norman strain does not show in Sicily, it is because the Norman lords conquered not by their own people, but with armies of alien adventurers.

Now if I am right, and the Norman blood is really a dominant strain, the conditions in England were especially favorable for keeping that strain a little select and apart. For at least two centuries they were the governing class, the nobles and gentlemen, striving to preserve the pure blood. They opened up to let in the able Saxon who forced his way through the mass. But that Saxon usually married a daughter of the Normans; and most certainly his descendants, newly made aristocrats, avoided misalliances and took to themselves women of the Norman breed. Dominance of strain did the rest.

The Wars of the Roses extinguished a great part of the old titles; but the nobles who stepped into their places were mainly of the dominant stock. The day of democracy and industrialism arrived. Brewer and ironmaker and boatbuilder began to force their way into the Peerage, until now a third of the House of Lords hold titles less than a century old. Nevertheless, in these newly arrived families, also, the Norman strain seems to dominate by the third or fourth generation. Hence this long-limbed, clean build, which is the outstanding fact in any gathering of the upper classes; hence the persistence of certain Viking traits, such as a love of out-of-doors and manly sports and a passion for seeking wild and remote corners of the globe.

That the portion of the British race which remains in England is conservative to its bones has become an axiom. Indeed, the Tory portion of Britain glories in that conservatism. Kipling, in his later stories, is never so sentimental as when he records the fact that this thing or that is done exactly as it was under old King John. Now for two or three centuries of frank Norman domination the middle and lower classes of England lived as political and economic serfs to an alien race.

Feudalism was feudalism wherever found. But the French serf and the French lord,

governing and the other producing. The seeds of that British mental peculiarity whereby the lower class admits its inferiority may have been sown in those days, to grow into the class system of the nineteenth century.

One may carry this theory of a dual race entirely too far. Yet it does explain much about England otherwise inexplicable to the citizen of an alleged democracy. The boundaries of the classes are hazy. It is often hard to say whether any given man belongs to the upper class or to the upper middle class. A family with a title is surely upper class; yet people not even related to titles are so classified. People of possessions and leisure, whose ancestors have held possessions and leisure for generations, might be described by the English as middle class. There, however, we come to subtleties and distinctions with which no American can deal until he has lived a decade in England.

The point of the matter for us is that the upper class is nearly synonymous with the governing class. As my friend, the Fabian Socialist, says, the English, even when it comes to a matter of popular election, usually like to be represented by a gentleman, by a man of good family, by one to whom, on social standards, they can look up. Perhaps that tendency is not strictly British; perhaps it is partly just human and belongs to settled states of society. There are conservative districts in France where noble blood is a political asset; and I find the same tendency here and there among the people of our East. At any rate, during a century in which the hereditary House of Lords declined in power and the elected House of Commons rose, during which the franchise was so extended as to become nearly universal, the upper class still held the reins of government.

Government was its business, as we may learn by inquiring into what sociologists would call the "economic sanctions" of the class. Only a few professions were open to a man of the upper class who wished fully to keep caste. Politics, law, the army or navy, the church—there you have the list. Law, in England as elsewhere, is the little brother of politics; the lawyer interprets, enforces—and gets round—the laws the politician has made. The army and navy are the defenders of government. The priest is a governor in ecclesiastical matters—especially when, as in England, there is an established church, sending its bishops, by right, to the higher legislative body.

Class Occupations

Until the great democratizing movement of the latter part of the nineteenth century it was degrading for the upper class to mix in any business except the supervision of its own landed estates. If the movement of the times carried lords into boards of directors, and managers of great industrial enterprises—like Lord Cowdray and Lord Cunard—into the Peerage, it still remained beneath the dignity of strictly upper-class people to get technical education. Engineering, expert chemistry, scientific research—such education was for the middle class.

If men of the upper class took them up these were but younger sons of large families, whose position in the family line debarred them from hope of inheriting entailed property. For the elder sons, who wanted to do anything at all—for the more brilliant sons—the army, politics, a government appointment to rule a bureau or a colony, the church. In all these positions the family money or estates would help to maintain the position. The practical work of production, even in its most scholarly and scientific aspects, was for the culls of the breed.

Along with this system ran a certain kind of democracy, rather more advanced than ours. That is one of the subtleties in complex old England that will forever puzzle us. A man, to be a laborer or a lord, had certain social and legal rights that society, on the one hand, and the law, on the other, enforced with scrupulous exactness.

Englishmen are always twitting us with the undeniable fact that we do not hang our rich men for murder or imprison them for theft. Somehow, their money and their

The anomaly of the situation is perhaps this: That a land of advanced democratic ideas permitted and cherished feudalism in its midst. The French, the Swiss and the Americans abolished long ago the idea of a governing class. Not until the later years of the nineteenth century did Britain begin the job of attacking the privileges and questioning the right of the nobles and gentlemen. That movement, accelerated by the advanced Liberal government, which held power for eight years before the war, has been going pretty fast. The House of Lords, stripped of many powers and privileges before the war, was tottering.

The Liberals were beginning to attack the land system, with its bulwark of entailed estates, which had put the soil of England under control of a few great individuals or families. "They are taxing the gentleman class out of existence!" moaned a Tory to me before the war. Indeed, certain Englishmen have told us, with perfect sincerity, that the class system is finished; whereas the class system is almost the first thing about England that strikes an outsider from a democratic country such as France, the United States or the British Colonies.

The Rise of Aristocracy

No; through two or three generations during which the tide of democracy has risen over England, during which she has changed from the *laissez-faire* theory of economics to the coöperative theory, the upper class and the governing class have maintained their grip. Other democracies have broken this grip of a class in the very beginning—we by process of law; the French by the guillotine. The reason for the anomaly lies, I suppose, not so much in the conservative character of the British people as in the merits and excellencies of the British upper class.

Nature, which abhors heights and depths in a breed, which works by leveling the mass and then raising it as a whole, destroys most aristocracies in a few generations by the working of natural or semi-natural laws. An aristocracy begins with the rise of able individuals from the mass; they marry with the daughters of other able individuals; able strains are born. This is the logical part of the aristocratic theory, and I think it stands the test.

Take, for example, the breed of kings. Even omitting those who have seized thrones by their own powers, like Hugh Capet, Napoleon and Cæsar, you find people of genius or high ability, such as Peter the Great, Augustus Cæsar, Frederick the Great, Elizabeth of England, or Charlemagne, occurring in far greater proportion among kings than among the general run of mankind. Exceptional opportunity is not enough to account for such human phenomena as these. In the British nobility are certain strains, such as those of Cecil and Churchill, which through every generation spawn men approaching or achieving genius. Arthur Balfour, of these times, is a Cecil, and Winston Churchill's name places him.

However, no sooner is an aristocracy founded along these lines than its self-destruction begins, through two special tendencies: In the first place, war is the particular interest of an oligarchy. Until this period of vast enlightenment in the possibility of destruction most wars have been fought by the nobles and gentlemen, plus the dregs of the population. Those sturdy yeomen of England who bent the long bow at Crécy and Poitiers are the exception. The officers, in old days, were aristocrats; the rank and file were the failures of peace.

Wars did to the aristocratic blood exactly what the present war is doing to the best blood, eugenically considered, of all the European nations. It stamped out those breeds that had been trying to defy the leveling law of Nature and to divide our human race into man and superman. Follow back the history of almost any title—a title is not the same thing as a noble race—and notice how often the race that bore it has come to a full stop, leaving the title to some newly arrived breed, because the holder and his heirs have all perished in war.

"I promise the nation, my administration
In vigor and health shall unfold.
This soup of perfection will give you protection,
And *your* constitution uphold!"

A sensible inauguration—

That's what it is when you install a supply of Campbell's wholesome Soups on your pantry shelf. You inaugurate better appetites, greater enjoyment of the home table, less drudgery and care. Above all, you inaugurate improved health and vitality. *As a body-builder and nerve-builder no other food is so consistently effective as good soup eaten every day.*

At times when you especially want a nourishing dish that is easy to digest and ready without trouble or delay, what a comfort to go to your pantry shelf and lay your hand in a minute on such a vitalizing, health-promoting food as

Campbell's Vegetable Soup

It combines sustaining nourishment with the most appetizing zest and savor.
Its basis is a rich and strengthening meat stock which we make from selected beef.

We blend with this an abundance of nutritious vegetables—choice white potatoes—Maine-rown, fine Jersey sweet potatoes, tender carrots, sweet yellow turnips, "baby" lima beans, small reen peas, cabbage, succulent okra, celery, parsley, tomatoes and "Country Gentleman" corn.

We also include rice, barley, macaroni "alphabets", fresh herbs, elicate spices, a hint of leek and onion and a smart suggestion of sweet ed peppers.

You could not imagine a dish more tempting or more satisfying. And comes to you cooked and prepared, all ready to serve in three minutes.

Your grocer will supply you with these nourishing Campbell "kinds" y the dozen or the case if you wish. And that is the practical way to buy.

Asparagus	Clam Chowder	Pea
Beef	Consommé	Pepper Pot
Bouillon	Julienne	Printanier
Celery	Mock Turtle	Tomato
Chicken	Mulligatawny	Tomato-Okra
Chicken-Gumbo (Okra)	Mutton	Vegetable
Clam Bouillon	Ox Tail	Vermicelli-Tomato

toward sharper and sharper pleasures, toward stronger and stronger dissipations, in which excess kills the breed.

So when an aristocracy runs its normal course we have such a group of people as the ancient nobility before the French Revolution. For generations the drain of war had carried off their strongest blood, unreproduced. Dissipation had done the rest.

Now the British upper class has a special history and a special character; and therein resides the reason why it has held the fort so long. Since the Wars of the Roses England has not known any war that much affected its noble blood. If there be an exception it is the Civil War; but that, after all, made small inroads on the breed. While Germany was murdering her nobles wholesale in the Thirty Years' War, while France was grinding up lord and commoner together in the Napoleonic Wars, Britain was holding her domain mostly by naval warfare, which involves comparatively small loss of life.

Again, the British nobility has never, as a class, weakened itself by dissipation. A little priggish, it has also been virtuous. By and large, the English have more character than almost any other people in the world; and this trait is especially prominent in the upper class. They have a sense of responsibility to their nation, their class, their religion. If this sense of responsibility operated to keep the feudal régime in England, it no less operated to keep the upper class wholesome.

Then, too, that excessive love of sport, against which Matthew Arnold ralled, has been an important conserver of upper-class virtue. As our Y. M. C. A. long ago discovered, athletic exercise is a great foe of Billy Sunday's Personal Devil. The hunts and polo, the rowing, the school football and cricket, were preservatives of the aristocracy, letting off that excess vitality which in softer oligarchies produced decadence.

Indeed, a zealot for democracy may say, without concession of his principles, I think, that no people in the world excel these for finished human beings. Physically they are a handsome race. I need scarcely describe the tall, lean, long-limbed, scrubbed young man of this class; the type is too familiar. The female of his species, robust, and yet usually graceful through exercise, her satin-complexioned flesh backed by a comely structure of bone, may lack the allure every Frenchwoman has; but most often of any women in the world do these upper-class Englishwomen achieve beauty.

Gentility and Efficiency

I have seen the men of five nations going forward to be ground up in the meat mills of the German Junkers, and have known all the revulsions of sentimental pity; but at no time have I felt such an artistic pity as when I have seen those young English officers marching up to have their fair young bodies rent apart.

Mentally, it seems to me, they are—or were—almost all you might expect of a finished class, sure of its position; usually sure that it has achieved the end of progress. If they lacked anything it was that quality of "soul" or "temperament," so common in the Latin and the Slav. Their schools and universities taught them not usefulness and efficiency—such education was for the bourgeois—but the kind of culture that is the final embroidery to a gentleman's character. The outsider, looking into the life of Oxford, is either appalled or amused by the loafing spirit of the place. Unless the student happens to have a special ambition for certain fairly empty and useless honors in mathematics or the classics, he can slide through to a degree with a paucity of work that makes the "snap hunting" of our American universities seem like industry.

The very teaching of science at the two famous and leading British universities has for its end not practical use, but that rounding out of the mind which we call culture. The practical education of England was for the middle classes, and its schools were elsewhere. To those students of the well-brained Scotch race who dig for twelve hours a day in the libraries and laboratories

schools, which follow their lead. The mind of the upper class lacked efficiency in the twentieth-century sense. It possessed information in speculative and historic fields, and—until you reached certain lines along which no British gentleman is supposed to think—breadth and an easy tolerance.

Talking once with a Tory peer I happened to mention that it was Lincoln's Birthday. That brought a discussion of our great liberator. Now I thought myself well informed, as every American should be, on Lincoln; but he bore me down by sheer weight of information. Governing is the business of this class; and their women, without direct participation in politics, have always acted indirectly. They have almost as much interest in the game as their men; and they, too, know affairs and the learning that is back of affairs.

"England," said Morley, "is a heaven for the rich, a hell for the poor, and a purgatory for the able." No life is more charming, better worth leading as an end in itself, than that of the landholding, leisure-class people of England. The English house party is the world's mark for a hospitality cordial without effusion, diverting without dissipation. They know the art of living. Indeed, that life is a weapon in their class struggle. It is so easy, so pleasant, that it acts as a soporific to those who want to waken England and the world.

The Passing of Feudalism

In spite of a "silly set" here and there, in spite of an occasional outburst of dissipation in small groups, this governing class, viewed by itself, has been a fine, admirable body of people, leading a singularly attractive life. There is only one reasonable ground of criticism: It has been too expensive. In terms of humanity, it has cost too much, as aristocracies always do.

Its peculiar ideas, customs and character, with their feudal tinge, suited it far better to govern in the eighteenth century than in the nineteenth or twentieth. In that era England was agricultural; it lived mainly by the soil. The lord, holding then, as now, the greater part of the land, had his upper-class sense of responsibility. He knew his tenants, servants and retainers as individuals. If he was true to the best traditions of his class he administered his position paternalistically, supporting them in adversity, nursing them in sickness.

This was an aristocratic idea; and at its very best it prevented the rise of the mass. It had, however, its virtues of affection between classes, loyalty, generosity. Its flower was that life of Bracebridge Hall, concerning which Washington Irving wrote. The muck about its roots was a kind of intellectual degradation in the peasant class, and the exaltation of property and position, which made the theft of a shilling or the poaching of a hare figure on the statute books as a parallel offense with murder.

Then came the industrial era. The able middle class of England discovered the modern factory system. The more successful of the *entrepreneurs* forced their way into the Peerage and the upper class. The older aristocracy, holding that land which is the basis of wealth, began to invest. And now the economic foundation of the class was rebuilt. The lord held perhaps the governing interest in half a dozen great factories or tenements in London, which housed ten thousand people. He did not know, he could not possibly know, his retainers and tenants. They were far away from the personal interest and benevolence of His Lordship and Her Ladyship.

Sympathetic imagination is the rarest of qualities in Northern blood. The upper-class Briton, wanting this sympathetic imagination, could usually see in industrial relations only the factor of dividends. There followed the *laissez-faire* doctrine of economics, the comfortable theory that if things were let alone they would right themselves. The history of reform in England since the early part of the nineteenth century is written in the assaults on this doctrine.

Yet not all the upper class was mentally crippled by lack of imagination. Indeed, one of those merits operating to keep the governing class in power was the self-sacrifice for conscience' sake which led

Other nations have witnessed aristocrats fighting their class, accepting chains and ostracism for democracy—like Count Tolstoy and Prince Krapotkin, in Russia, or the Marquis de Lafayette, in France. But no other has ever possessed a whole group passing on the torch from generation to generation. The English have a genius for political martyrdom; and when a Briton gets it into his rather slow, conservative intelligence that a thing is right, he goes through with that thing, though the gates of hell oppose him.

When this governing class entered Armageddon, its most bitter period of trial, old ideas still prevailed. The gentleman was made to lead; the mere workman to follow. Gentlemen were the officers of the Old Army, which virtually ceased to exist after Mons, the Aisne and Ypres; and lower-class men the rank and file. The aristocracy, true as ever to the responsibility it could see, flocked to the colors; and, at first, the officers of the New Army were universally chosen from this class, with rather more regard to their standing as gentlemen than to their qualifications for the job in hand. They died like men, without flinching; and that, it seemed to one who saw the period just after first Ypres—when the Germans were holding the line by machinery, the British by lives—was about all they did. How could they do better? The direction of warfare now is a matter of exact scientific knowledge. Of what use was the long, ripening, leisurely culture at Oxford and Cambridge; their dialectics and Greek roots; their history and philosophy? They could only do their best—and die.

That they did; and as England straightened things out the other side of the shield began to show. At school, at the universities, all through their education, their fellows, as much as their instructors, had been pounding into them the cardinal principles of life expressed in two old English phrases: "Keep a stiff upper lip!" and "Stand the gaff!" Those principles held them strong during the discouraging days of second Ypres, of Festuberg, of Loos, when the muddling at home had denied them enough equipment and proper ammunition. It gave England breathing space to look about, collect her thoughts, and start on the right track. "Here the battle of Waterloo was won," said Wellington as he viewed a public-school cricket field. There, perhaps, Armageddon was half won for England.

Plain Men in High Places

The system, however, had to go, at least temporarily and partially. Mid-course, England put her military affairs into the hands of a man who began life as a footman; her political affairs into the hands of a man whose uncle cobbled shoes to educate him for the bar. "Our lower-class soldiers want to be led by gentlemen; they will not follow anyone else," said the heads of the army in 1914; and they proceeded on that theory. But, when the British family in Barrie's play was wrecked on a desert island and ran against primitive necessity, it was the butler who, being endowed with practical intelligence, became king of the island. So, in that crisis of the primitive, which was Armageddon, artificial distinctions went down.

The failures of peace often become the successes of war. Men of military capacity began to appear in the ranks—sometimes gentlemen; sometimes not. In the beginning gentlemen were hurled into the officers' training corps who knew no more about a rifle than that it is a thing which shoots. Now the new officer must have done his turn in the ranks. The average social standing of officers went steadily downward. An officers' training corps I looked over last autumn is full of men registered in their papers as "clerks."

Now when such men as the "Kipps," whom H. G. Wells has described for us, achieve in any great numbers the British corps of officers, there is a revolution in British thought. The laboring class is not represented to any great extent in the command of the New Army; but the British have a reasonable explanation for that: To make an officer, you need a basis of education—the cultivated ability to grasp

tion is more generally diffused than in Great Britain. The barrier to the working class in the British corps of officers is less lingering snobbery or lack of ambition than want of preparatory education. The British upper-class snob may call these new arrivals "T. G.'s"—or "Temporary Gentlemen"; but England, after the war, will know many a temporary permanency.

The England of the Future

"England changes not," says Balfour. "We shall have, after this war, a new England—the newest country that exists," says Lloyd George. The shopkeeper's clerk, who has worn on his sleeve the three stars of a captain or the crown of a major, who has messed on nominally equal terms with the sons of lords and baronets; who has matched flesh and brain and nerve with aristocrats of the same military rank, and found himself their equal—will he live the rest of his life in the spirit of the old-time British shopkeeper? The governing class cannot and will not open up to let him enter. He has not the financial background; and, for all the expressed aristocratic scorn of money, the fact remains that it constitutes the essential, indispensable basis of any aristocracy. He must go back to what he was before the war—Captain Smith, Lieutenant Jones, cutting cloth or directing lady customers to the fifth aisle, rear! Go farther down the military scale to the private in the ranks, who has faced death every day for two or three years; who has dealt such strokes for England as man never dealt before. Will he be again the respectful, contented, subservient domestic, the well-oiled cog in an aristocratic machine?

Barrie, in the last act of his fantasy, which I have mentioned above, shows the shipwrecked English family, and the butler who became king of the desert island, back again in England. The butler, in the old environment, has reverted to type. He is once more the perfect English servant. Does a universal truth about this race lie under Barrie's fantasy? I think not. But, as I have democratic leanings and am an outsider to this game, I put forward my opinion with hesitation: I think that, after a possible setback in the four or five years following the war, the democratic tide in England will roll on more powerfully because it has been diked temporarily.

Two special factors will help to break the hold of the aristocracy: They were the first class of all to volunteer; as officers of the early Kitchener forces they occupied positions of great danger. The mortality among them has been very heavy. Before the war had gone a year, a man of the upper classes told me that the crimp in the noble blood of England was greater than in the Wars of the Roses. The war is now approaching the three-year mark, with the greatest losses for England, and for the upper class, perhaps yet to come.

Also, the economic foundation of the class, without which it cannot exist, stands in peril. "They were taxing us out of existence, even before the war," said an aristocrat. The burden of taxation for war debts will fall most heavily on the class that holds the land of England; nothing in the future seems so inevitable as the break-up of the great estates and the restoration of land ownership to the yeomanry.

The system will pass, though not all at once. The British do not arrange progress in that manner—they hate anything sudden; we love it. Then, too, old formulas and ways of existence linger long in new states of civilization.

Though the end will not come until we are all dead and gone, the system will perish—with its honors and ermines, its pageants of power and pretty ceremonies of sport, its hunting parks and preserves, its honors and emoluments.

One who holds democratic convictions, but who loves the romance in life, mourns its passing a little, as he mourns the passing of the lotus days in Egypt or the age of chivalry. He may mourn, indeed, on less romantic grounds. For all the faults we find in it, for all our opposition to the system that maintains it, the British aristocracy has been perhaps the most worthy oligarchy since the great ephemeral day of Athens.

85% MAGNESIA"

aves the Nation's Heat—

5% Magnesia" is the matchless in-ation. It makes one ton of coal do work of two tons.

at is why most of the big buildings the nation, like those illustrated, e their steam-pipes and boilers cov-d with "85% Magnesia."

at is why in the U. S. Navy "85% gnesia" is the regulation pipe-cover-; why in all modern locomotives it is boiler-covering; why in power-nts, factories, railroad terminals, els, hospitals, sky-scrapers, it is more d than all other insulations combined.

Keeping Heat as important as *Making* Heat

at is the greatest runaway in the iverse. Bare metal pipes can't keep from escaping. That's why you have tal radiators—because they give away heat. Every inch of metal is an en door for heat to rush out into oler air.

the *carrying* pipes of the steam, in se buildings, were bare metal, half the heat would run away before it got to the first floor. But those wasteful iron pipes are all jacketed with a thick, white casing of "85% Magnesia."

So, while coal *makes* the heat, "85% Magnesia" *keeps* the heat till it does its full work.

Magnesia is Nature's Insulation

When Nature made heat as a runaway, she made Magnesia as the best wall to hold it in.

Every inch of Magnesia contains millions of tiny air-cells, each holding its bit of motionless air, like a Thermos bottle. Through that mass of walled in "dead air," the restless heat cannot escape.

When to 85 parts of this Magnesia are added 15 parts of asbestos as a binder to give structural strength, you have the most powerful heat-holder in the world.

That is why *you* need it in your residence, in your plant, in whatever building you have a hand in erecting.

complete Specification for the scientific application of "85% Magnesia" is sent free upon request to all architects and engineers.

THE LAST THROW

(Continued from Page 10)

"Don't you?" inquired Mrs. Pincus.

"No; I don't!" snapped Mr. Pincus; nd his voice rising, his face filled with ragic triumph, he added: "Yesterday they old me so! They won't give Pincus a place, because he deals in stocks—yes! Put hat in your pipe! Hah, hah!" laughed Mr. Pincus wildly; and Minnie gave him smile.

"Dress linings, it is, Pincus," she re-oined. "Back you go to them dress linings f with my hands I have to buy a business or you!"

He tossed his arms in contempt.

"You buy a place? Rats! For ten t'ou-and dollars, the least it costs to buy a dress inings place! And where do you get them en? Is it off the bushes—vat?" Jamming n his hat he gave still another snort of lisgust. "You make me sick!" said Mr. Pincus.

"Oh, sick are you?" responded Mrs. Pin-us. "Then, why not take something for it t the drug store?"

He did not even reply. Slamming the loor behind him, Mr. Pincus scuttled down he stairs.

He still had one string left to his bow. Down at the office—down at Rooker, Burke & Co.'s—he might find somebody who'd elp him out, perhaps. He had that tip, adn't he? It was a hot tip too. If those ellows would do the regular thing—come cross, you know—he'd let them in on it. n that way he could still get something rom the tip. The dream, however, was as dle as all the others. What! Take a tip rom Pincus? Pay Pincus for a tip when or years he'd sneered and sniffed at tip-ters? Mr. Pincus, in short, had been hoist vith his own petard.

Balked and baffled, his courage gone, e'd sat there all the morning, half crazed n his desperation. Thus, when Ingot, soar-ng, crossed 50, Mr. Pincus no longer had een able to restrain himself. Rising with cry, the once calm, once imperturbable labbler had dashed out and away from the cene of his disaster.

Such a disaster too! Here he was, armed vith a tip, a pointer, that meant thousands nd thousands in the market; and yet here e must stand by, idle, and watch it die on is hands! It was terrible! Worse than errible; it was criminal! Minnie, too, had nocked him! That was the worst of all vith Mr. Pincus. Had it not been for Min-ie's three thousand, that money lying idle n the bank, he might even have forced imself to face it. The loss of the money vas not everything. It was the fact that, vith that killing almost in his grasp, Min-ie had stood by and seen opportunity go o waste!

"*Ach!*" Mr. Pincus exploded violently.

Well, he'd show her! She'd see if he went ack to "them linings"! In that, anyway, vas some satisfaction. Even though she ried it, she couldn't drive him back to Bleecker Street.

She couldn't, not even if he was willing o go. It would show Minnie the extent of vhat she'd done.

What had happened, though, was but a art of it. Mr. Pincus had still to face omething else. He was rolling on, mum-ling and muttering to himself, when at the treet corner a tall, shabbily dressed man arted out of a doorway and gripped him y the arm.

"Pink! Pink!" he cried. "What's hap-ened? I've been waiting here two hours ow."

Mr. Pincus roughly shook him off.

"Out of my way, loafer!" he snarled, and vas striding on when Blake again gripped im by the arm.

"What's happened, Pink?" he demanded vildly. "You were going to stake me to a undred shares, weren't you? Don't tell ne you didn't do it!"

An unintelligible murmur rumbled out f Mr. Pincus, and again he sought to free imself.

"No, no, Pink!" shrilled Blake. "You've von thousands—you know you have! I vas up in a place there—a barroom round he corner—and I've seen the tape. You've von thousands and thousands, haven't ou?"

"T'ouzands?" inquired Mr. Pincus. A augh escaped him then. The laugh, though, vas harsh—bitter and devoid of merriment. Oh, sure! I win t'ouzands! It's in my mind win them. Now ven I lose my mind I lose nem t'ouzands too!" Then he told Blake what had happened. "We're bust, Blake—you and me! My old woman she don't let me have that money, and your tip, it blows up in my hand."

Stricken, Blake stared at him.

"She wouldn't let you have it? She wouldn't do it to save me, even though I'd once saved you and her?"

So it was, and shamefully Mr. Pincus admitted it.

"That woman ain't got no heart, Blake. Never before would I suspect it; but now I know. All she thinks of, I guess, is that flat of hers and getting ready three meals a day. . . . Oh, vell," sighed Mr. Pincus, "all them women is like that. A feller c'd be as well dead or a widower." Then he gave a shrug. "Just the same, yes," added Mr. Pincus; "I show her vat!"

Blake, in spite of his distress, stared at him.

"You mean you're going to leave her?"

No; it was nothing like that. He couldn't leave Minnie even if he wished to. Min-nie wouldn't let him. What Mr. Pincus planned was something different. He meant to go home; that was all. Then, when he got home he would stay there.

"That fixes her!" explained Mr. Pincus grimly. "After I sit round a week she gets sick of the sight of me. Then she wishes she hadn't!"

It was a fine idea. It was, as Mr. Pincus himself would have expressed it, "swell!" However, though it would indeed have created the result he'd anticipated—that of making Minnie sick of the sight of him—Mr. Pincus had overlooked one salient thing. That thing was Minnie herself.

The hours passed. Noon went by; it was one o'clock, two; then three. At three the market closed. Long ere this the news about Ingot was out and discounted, but still the stock had climbed. At the close it stood firm at 70¾.

Mr. Pincus almost wept.

"*Himmel!*" he cried. "Forty points it's up, and that tip busts in a feller's face!"

Blake was still with him. Together they stood in a barroom scanning a news-ticker's tape; and curiously it was Blake now who consoled and comforted. In his hopeless-ness calm had come to him.

"Well, no use worrying," said Blake; and again Mr. Pincus exploded violently:

"Not worry, vat? For why shouldn't a feller worry? If in one day you lose twelve t'ouzand dollars, which is forty points on three hundred shares, I would worry all I like! You are crazy, man! I bet I worry. I worry all I wish, I tell you!"

"Come along, Pink," urged Blake. "You're coming, aren't you?"

Yes; Mr. Pincus was coming. Blake was going home with him, and when they got there Mr. Pincus was going to give him a suit of clothes. These Blake meant to ex-change for another suit—one that would fit him; after which Blake meant to hunt another job. Mr. Pincus, however, meant to seek no job. His mind was still fixed firmly on his original plan of sitting at home till Minnie got sick of the sight of him. What is more, the minute he got home he meant to announce it to her.

Five o'clock had just struck as Mr. Pin-cus, accompanied by Blake, climbed the stairs of the West Side flat house where Mr. Pincus dwelt. At five Minnie was always at home. Nothing, no matter what it was, ever prevented that. Home at five, Min-nie put the dinner on the stove, and at six she put it on the table. A chronometer was not more fixed and accurate in its move-ments than was Minnie in her domestic arrangements. To-night, however, there appeared to be a change.

"Vell, here we are!" said Mr. Pincus grimly.

His jaw set, his manner all ready to show Minnie what he thought of her, he stepped into the hall. To his surprise the hall was dark. Furthermore, the kitchen also was dark. No dinner was on the stove, either—no scent of it in the air.

"Hey, vat?" inquired Mr. Pincus, star-tled; and, hurrying down the hall, he was halfway to the kitchen when the parlor door was opened abruptly, letting forth a flood of light.

Mrs. Pincus stood in the doorway. She had her hat on, as if she'd just come in. Her air bland, she smiled.

"Vell, Benny?" she remarked.

The New Hupmobile

The Beauty-Car a Year Ahead

Ideal Made Real In Our Four-Million-Dollar Factories

Bright finish, long grain, French seam upholstery.
Luxuriously improved seat cushions and backs.
Moulding finish conceals all upholstery fastenings.
Neverleek fast-color top, black outside, tan inside.
Tonneau quarter curtains, cut integral with the top.
Front and rear edges of top finished with moulding.
Bow spreaders to carry top when folded.
New "Lift-the-Dot" fasteners for side curtains.
Door-curtain carriers fold with curtains, and drop into place instantly.
Tonneau carpet fastened with snap fasteners. Tonneau sills carpeted. Entire tonneau finish improved.

Satin-finish instrument plate. Ammeter supplied to show rate of battery charge and discharge.
Hand grip-pads on doors. Improved door handles.
Larger door pockets, with weighted flaps.
Bodies, Hupmobile blue; hood and fenders black. More paint and varnish, handsomer finish.
New type demountable rims. New type rim carrier.
Adjustable foot pedals. Clutch action very light.
New carburetor air control. One switch for ignition and lighting.
New dimming device graduates brilliance of head lights.
Tail lamp operates independently of other lamps.

The World's Best Four Now The Beauty-Car

The Hupmobile has always been a quality car.

It stands, also, at the pinnacle of performance.

It is, in very fact, the world's best Four. That needs no further proof than the testimony of 17,000 owners.

In our four-million-dollar factories, with nearly $1,000,000 of recent improvements, it now receives the outer dress befitting its famous inner virtues.

Many tell us we build the car too good. That we pay too much for things people never see.

If We Build Too Good: Why—We Build Too Good

We could not be content to give Hupmobile owners less.

Quality and performance—these long have been our ideal.

Surely we have reached our goal in a car fit to stand as the world's best Four.

Five-Pass. Touring Car,	$1185	Roadster	$1185
Year 'Round Touring Car,	$1385	Year 'Round Coupé	$1370
Seven-Pass. Touring Car,	$1340	Sedan	$1735

f. o. b. Detroit

The Mark of Superior — *Motor Car Service*

So we studied people's style-wants.

We prepared for them by building new factories.

In The New Hupmobile, see how we have met them. How we have gone a year ahead.

Note the new upholstery. The gloss, the softness of the leather. The depth of the cushions. The stylish French seam.

Note the finish and fittings of the tonneau—and the front compartment, too.

Be Guided By Your Own Style-Sense

You see the rear quarter curtains on few other cars—unless costlier. A top fashioned in our own factories, on Hupmobile design.

Dim the headlights. See how the light is graduated—down to a dull pin-point glow.

Drop the side curtains into place. See the ease of placing the supports in the doors. They convince instantly that here, at last, is an open car which quickly avails the perfect bad-weather comfort of a closed car.

Let your own style-sense guide you as you go over the car.

Do this, and you can have no doubt that The New Hupmobile is indeed the Year-Ahead Beauty-Car.

adiolite $2.00

iumph $1.50

Midget $2.50
glow dial, $3.50

re

A Quarter-Century of Ingersolls

IN 1892 the House of Ingersoll was marketing but one model; now there is an Ingersoll for everyone—for every use—at prices from $6.00 down. We'd like to make you better acquainted with the newer models.

"Radiolites"

Most interesting of all are the "Radiolites," watches that tell time in daylight and dark. The hands and figures are thickly layered with a new self-luminous substance called "Radiolite." "Radiolite" contains genuine radium (only a little is needed) and glows as brightly as ever for at least eight years—probably much longer.

Jeweled Watches

The Reliance is thin, accurate and handsome. You now have a choice of snap case, dust-proof screw case, and extra high-grade ten-year gold-filled case.

The Waterbury is a man's watch, small and with four jewels. It is accurate, sturdy and good-looking.

Special Watches

Have you seen the "Two-in-Ones"—ideal for desk or bureau? And the strap watches in plain and glow dial, that both men and women are wearing? You can see them at any Ingersoll dealer's store, alongside the familiar Triumph, Eclipse, Junior and Midget, and the Radiolites and jeweled models.

CANADIAN PRICES: Radiolite, $2.25; Radiolite Two-in-One, $2.50; Reliance, snap, $3.50, screw case, $4.00, gold-filled case, $7.50; Waterbury, plain dial, $3.50, glow dial, $4.50. Other models same as in U. S. A.

ded Mrs. Pincus, jabbing
in with her thumb—"yes;
and this loafer here, too, he goes back to his work as well!"

Mr. Pincus stood there gaping. At Mrs. Pincus' words, however, he gave a violent start.

"Vat? I go to work?" Starting again he composed himself, a scowl on his brow. "Vat work, Mrs. Pincus?"

"Dress linings," she replied.

In disgust, in triumph and mockery, Mr. Pincus raised his voice:

"No; I don't! I don't work for any dress-linings feller! Already I tell you they won't give a place to Pincus! . . . Yes; that for you, smarty!" ejaculated Mr. Pincus.

And, her smile as imperturbable as ever, Mrs. Pincus still more widely smiled.

"No; you don't work for no feller, Pincus. Instead, you work for me!"

"For you!" Mr. Pincus gaped open-mouthed. "Vat? I work for you?"

Mrs. Pincus nodded pleasantly.

"Sure; you work for me. It is in the dress-linings trade, like I say. I buy out a business, you know."

Mr. Pincus stared at her for a moment.

"You buy out a business, vat? Don't make a fool of me, Mrs. Pincus! A dress-linings business costs ten t'ouzand dollars!"

"Sure," nodded Mrs. Pincus; "ten t'ouzand I pay for this one, also. Five t'ouzand it is cash, and for the balance I give a note. This afternoon I do it, Pincus." Then, smiling sweetly, Mrs. Pincus gave him a jab. "To-morrow you go to work, Benny! You work for me, you know."

A great light seemed all at once to have dawned on Mr. Pincus; his face moist, he wet his lips together.

"Say," he said, and his voice cracked as he said it; "say, vere is it you get them t'ouzands of dollars—vere, I ask it—vere?"

At once she told him.

"It was in the market, Benny. That tip is a good tip; so I play on it myself. If you play it, you know, and get the money, you stay down a loafer always. So this morning, after you go out, I take the Subway down to Rooker's. Then I slip in by the back way and buy Ingot, like you said. Ingot goes up; so at three o'clock I tell Rooker to close me out. Afterward I hunt up Mrs. Blake, here, where she lives."

"*Ach!*" gasped Mr. Pincus, and he gaped. "You do that? *Gott im Himmel!* How much do you clear?"

"It was twelve t'ouzand nine hundred eighty-two dollars *und* a quowter," replied Mrs. Pincus—"only half of it, fifty-fifty, it belongs to Mrs. Blake, there, like I offer her."

"Yes; but I wouldn't take it!" protested Mrs. Blake.

"Yes; but I make you take a couple o' t'ouzand, anyhow," Mrs. Pincus rejoined; then, with another jab of her thumb, she again adroitly indicated Mr. Pincus. "Even for this loafer—this feller here—two t'ouzand it is cheap to get him back to work again. Hey, vat, Pincus?" she demanded.

Mr. Pincus did not seem to hear her.

"Bleecker Street!" he was breathing. "*Ach, Himmel!* Bleecker Street!"

"Sure; two doors from the corner, Pincus," rejoined Mrs. Pincus; adding grimly: "Eight o'clock, too, every morning, you punch the time clock also. I don't have any loafers hanging about my place!"

Moist, palpitating, Mr. Pincus drew a hand across his brow.

"A time clock? You run the place also?"

It was so, and Mr. Pincus wiped his brow.

"*Himmel!*" he breathed. "If last night I knew this I'd have choked, like you told me, before I give you that tip!"

e Road to Ballymena

By Mary Lanier Magruder

d days; the ould road
llymena going;
ill; the ould thorn
its buds a-blowing!
vind now on the heather;
heart in me;
re we'll walk together
l road to the sea.

ay go by in keening
t's gone before.
ht has but one meaning
hearts, asthore!
ouds lie on the could rocks;
heart in me;
y ship by the ould docks
'l wear to sea.

"Down the ould road, in the ould town,
All the bobbins flying
Weave a wedding veil for Sheila—
Oh, my heart is dying!—
His the hold of Ballymoney;
Mine the open sky;
His the white loaf and the honey—
Dawn and dew have I!"

The gray night, the fey night,
And all the wild winds blowing;
A wanderer on the ould road
From Ballymena going;
With only memory to beguile,
And a broken promise his;
But in his heart is Sheila's smile—
And on her lips his kiss!

BLUE STREAKS

$3.00 each

Guaranteed

THAT bicycle you used to ride—is it rusty and dusty in your garret or woodshed? Bring it back again into service with Goodyear Blue Streak tires. Get it out! For Blue Streaks have met that bicycle tire bugaboo. You may now buy really dependable tires—Goodyear Blue Streaks, everywhere. Tires that let you forget that former high cost of bicycle upkeep. Goodyear has done that for bicycle folk by making only one bicycle tire, and making that one tire really good. Blue Streaks hold fast to a high quality standard. And, they're packed with happy, healthy miles that make your heart glad.

Put that bicycle of yours back on its feet again! Make bicycling better than ever, on Goodyear Blue Streaks.

Even with material prices as high as they are today, Blue Streaks cost only $3.00.

Blue Streaks are standard everywhere.
One quality, one guaranty, one price.

Utilization of potato in ...re of soap was prohibited and ...ed for starch was restricted. ...es had been continued from ...year, both for retailer and

...ary scarcity in potatoes de-...e cities. This was at first attributed to manipulation. An inventory taken in January, however, showed that only eighteen million tons remained, from which the seed had still to be reserved, leaving only eleven million tons to last for six months. Potatoes had been consumed by man, beast and industry at the rate of over five million tons a month. Thereupon potato cards were introduced and the attempt was made to limit the feeding of potatoes to livestock. The potato card for swine, for example, allotted four pounds a head a day; for man, one pound. It was when the authorities determined to uncover and seize the stocks of stored potatoes that the unexpected losses by decomposition became apparent.

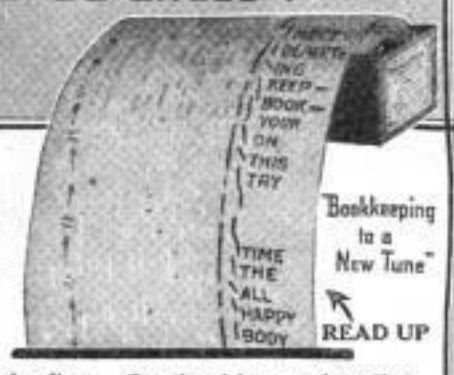
The food controller, on assuming office, promptly forbade any feeding of potatoes to livestock. The potato cards were not guaranteed, and in the large cities the intake for each person during the spring months was often as low as a quarter of a pound a day; to make up for the missing potatoes equivalent rations in bread and flour were issued. The crop of summer potatoes came upon the market with a rush, as the maximum prices were high and scaled downward in order to increase the offerings. The growers brought out the potatoes before they were mature and flooded the market with them. So anxious were the growers to harvest the new potatoes that in some sections the Whitsuntide holiday was not granted to potato workers. The summer crop of potatoes was estimated at some eleven million tons, and was supposed to last three months.

The Imperial Potato Card

Early in August the cities were flooded with potatoes in carload lots. The poor, cognizant by announcement that prices were scaled to fall, bought only from hand to mouth; as a result, thousands of tons decomposed and were lost. Nevertheless, even at this time the potato card and the prohibition of feeding to swine were not suspended. Two weeks later the cities were again empty of potatoes. The growers had ceased to harvest potatoes when the prices fell; they were engaged in the harvesting of grain, and the people in the cities had to wait for regular rations of potatoes until the digging of potatoes could be again resumed.

The potato crop of 1916 was small, supposedly as low as thirty-six million tons, and not of normal grade. The food controller has established an excellent system of regulations: All users of potatoes have to hand in the figures for their year's requirements. An inventory of potatoes has been made in every district. The required amounts are subject to revision by the central authorities; and when the total figures for demand have been checked up against the total supplies available, all of which have been requisitioned and seized, the denominated amounts of potato belonging to each district, community, household and factory were to be set aside or delivered.

The unclaimed potatoes, if such there were, the authorities could dispose of as they chose. Extensive drying of potatoes was being done under official supervision, and every effort directed against waste. Feeding of potatoes to animals is permitted only to swine and geese. The potatoes of the horse's ration of last year were replaced with oats, and every possible measure taken to prevent the peasant from mulcting the crop.



The imperial potato card was issued in October, a guaranteed card, for which each household must select a retailer, who could obtain supplies only by presentation of the collected cards. The potato ration per day for grower and industrial classes was fixed at one and one-tenth pounds for women, children and light workers; two and two-tenth pounds for hard workers, the ration per head not to exceed one and three-quarter pounds, with extra allotments for the army, the sick and wounded, and children whenever necessary. This ration means the use in food of about nineteen million tons, so that apparently, when the industrial demands are satisfied, not over five million or six million tons will be available for animals.

In the spring of 1915 the people were officially urged to plant vegetables, especially

Lighting Battery of the same rugged experience gained in the hardest fields into Gould Starting-Lighting Batteries.

attery ttery- ality. ty of ttery rests ard ver hat ex- te-

The men who make Gould Starting-Lighting Batteries are long-trained in building batteries for requirements vastly more severe than your car demands. *Built inside* of the Gould Battery is the service you want—*service on the car*. When you buy a new car specify a Gould Battery. When you need a new battery remember that over 2,500 dealers can supply a Gould of the correct type and size for your car.

GOULD BATTERIES FOR ELECTRIC VEHICLES have established remarkable records for capacity and long life.

arce and will continue to be
very poor. It was all impor-
armalade and jam for break-
would be nothing left of the

Continental breakfast. The exclusion by the blockade of the large supplies of dried fruits previously obtained from California has been keenly felt.

When sugar became scarce the law prohibiting the use of saccharine was abrogated, and in March the public was encouraged to use saccharine. Two months later this use became compulsory in certain directions. Since then, eating houses have not been allowed to serve sugar with beverages, and many soft drinks and other addenda of the dietary must contain saccharine instead of sugar. During the summer it was widely used in jams and marmalades, and also made its appearance in beer. It was frankly admitted by the authorities that the use of saccharine was a questionable policy, as it was a constant reminder to the people of the straits in which Germany, a sugar-producing country, found herself.

Saccharine can never be termed a substitute for sugar from the gustatory or any other point of view. Certain articles of food containing saccharine have the normal taste, as though they contained sugar; to other articles of food, however, an abnormal after-taste is given by saccharine, a condition particularly noticeable in beer. Amazingly enough, though ironically so to the people of Germany, the supply of saccharine was so short that for a time it was almost as difficult to secure saccharine as to obtain sugar—a condition, of course, that was only temporary.

The Scarcity of Eggs

A subject that possessed an interest in the cities, and occupied an amount of space in the newspapers out of all proportion to its importance in the diet, was the egg. The peacetime consumption of eggs was two per capita per week. The domestic production varied from sixty-five to seventy-five eggs per capita per year. These were mostly consumed in the country districts and the cities supplied largely by importation. The eggs secured by importation came principally from Austria-Hungary and Russia—in reality from Russia, since they were largely Russian eggs that came from Austria-Hungary.

A fragile and perishable article like the egg is a poor blockade runner; and when Austria-Hungary, at the beginning of the war, prohibited exportation to Germany, the consumption was reduced to the plane of domestic production, since the surrounding neutral countries produced few eggs. Since the imported eggs supplied the cities, a situation was created that was just made to order for the market manipulator. During the first year of the war, when there was little scarcity of food, eggs could always be obtained in the city markets at high prices. During the second year of the war the country districts were less inclined to send their eggs to the cities, except at very high prices. When the spring of 1916 appeared the usual spring increase of eggs was awaited with great expectation.

But the eggs did not appear and winter prices were maintained.

The use of eggs had been prohibited in ordinary cakes and limited in the making of tart. Local regulations appeared in many cities, fixing maximum price, limiting the number that could be bought, prohibiting the serving of eggs at breakfast—and finally the egg card appeared. The wealthy classes had become very dependent upon eggs in their diet and the egg dealer preyed upon them. Among the students in Germany a popular story was current long ago to illustrate the limitations in the average student's wardrobe, depicting him counting his clean laundry, ending with *und das Hemd*—"and the shirt." Now it had become *und das Ei*—"and the egg."

The wealthy classes resented the restrictions on importations made by the central purchasing bureau, convinced that if the authorities had not centralized imported eggs, but had permitted buyers of eggs in Germany to compete with buyers in foreign lands, eggs would have been available, though the prices would have been very high. As a matter of fact, the supply of domestic eggs was not reduced below the figure for peacetime. In peacetime a few million Germans consumed eighty per cent of the eggs. The total number coming to the cities was reduced and most of these went to the wealthy and to public eating houses.

In June the number allotted in the cities was two per week per head. In July this was reduced to one per week, which was the allotment in September and October; the

Digitized by Google

price, seven cents. In October the controller enacted regulations of confiscation in order to protect the needs of children, the army and the sick. The producers were supposed to retain a portion of their production; the remainder was to be turned in to the food controller.

When it becomes a question of dividing the eggs of the peasant's hens between the war nutrition department and the peasant's wife, it will be safe to place the wager on the woman. In the channel of trade the egg is too evanescent an object to be placed under rigid regulation. Enforcement of the egg regulation in hotels was out of the question, and circumvention was always accomplished. When the writer was last in Berlin, in October, he could without difficulty secure an omelet each day in the same eating place, and this not out of any regard for his being an American.

In peacetime the majority of Germans had not over two eggs a month, while a few had thirty a week. Now all have three or four available a month. The cuisine of the well-to-do is hit hard by the lack of eggs, and the well-to-do have loud voices. It is a clamor for luxury. The government will, under these circumstances, find it difficult to effect a confiscation of the peasant's eggs for any other purpose than the needs of the sick and the wounded; and one may be assured that, once an egg reaches the channels of trade, it stands little chance of ever landing upon a poor man's table.

During the first year of the war there was no scarcity of tea, coffee, cocoa or chocolate. Apparently the stocks in Germany were large; considerable amounts were obtained in Belgium; a large amount of Brazilian coffee was confiscated in Hamburg and Bremen; and until July, 1916, importation was not seriously restricted. During the past six months, however, there has been scarcity, which has been met by regulation of use. The first regulations made obligatory the use of substitute with coffee, half and half; and all middlemen were wiped out, retailers securing supplies direct from the authorities. Hotels and restaurants were allotted half the amounts to which they were accustomed, with equal amount of substitute.

Supplies of Chocolate and Milk

In October final regulations were issued. Coffee now comes in three grades—ten, twenty-five and fifty per cent coffee; the rest is substitute. The best coffee has the maximum price of sixty cents a pound. Many substitutes are on the market, composed largely of browned grains, with a certain amount of chicory. The quality of these surrogates finally became so bad that they were placed under the control of the coffee commission.

Tea never possessed the standard of a man's drink in Germany, and the supplies were satisfactory until last May, when the tea was confiscated and the retail sale regulated, the limit being set at half an ounce. The use of substitute was not made obligatory; the prices varied from one to two dollars a pound.

Cocoa was little used as such in Germany and chocolate to a very large extent in foods rather than as a beverage. The writer was never able to understand where the limitless supplies of chocolate in Germany came from. In the smallest hamlet and the largest cities were shops after shops filled with chocolate candies, often of very low grade, but, nevertheless, inexplicable when viewed from the standpoint of quantity. Up to November there was no limitation in the use of chocolate.

No item of the German food supplies has attracted more attention in Germany and in the outside world than the scarcity of milk; and ever since the beginning of the war periodic appeals have been made to the governments of neutral countries to induce them to exert their influence toward such modification of the blockade as would permit the shipment into Germany of milk for little children. Laudable as was the motive of these appeals from the humanitarian standpoint, they were based upon a misconception of the amount of Germany's milk supply that naturally went to the children, since they assumed that any reduction in the milk supply must naturally fall proportionately or disproportionately upon the children.

This was an erroneous assumption. According to the Eltzbacher Commission, from forty to forty-three per cent of the milk produced in Germany in peacetime was

Tire Saver Kit

Perfecting Your Pleasure

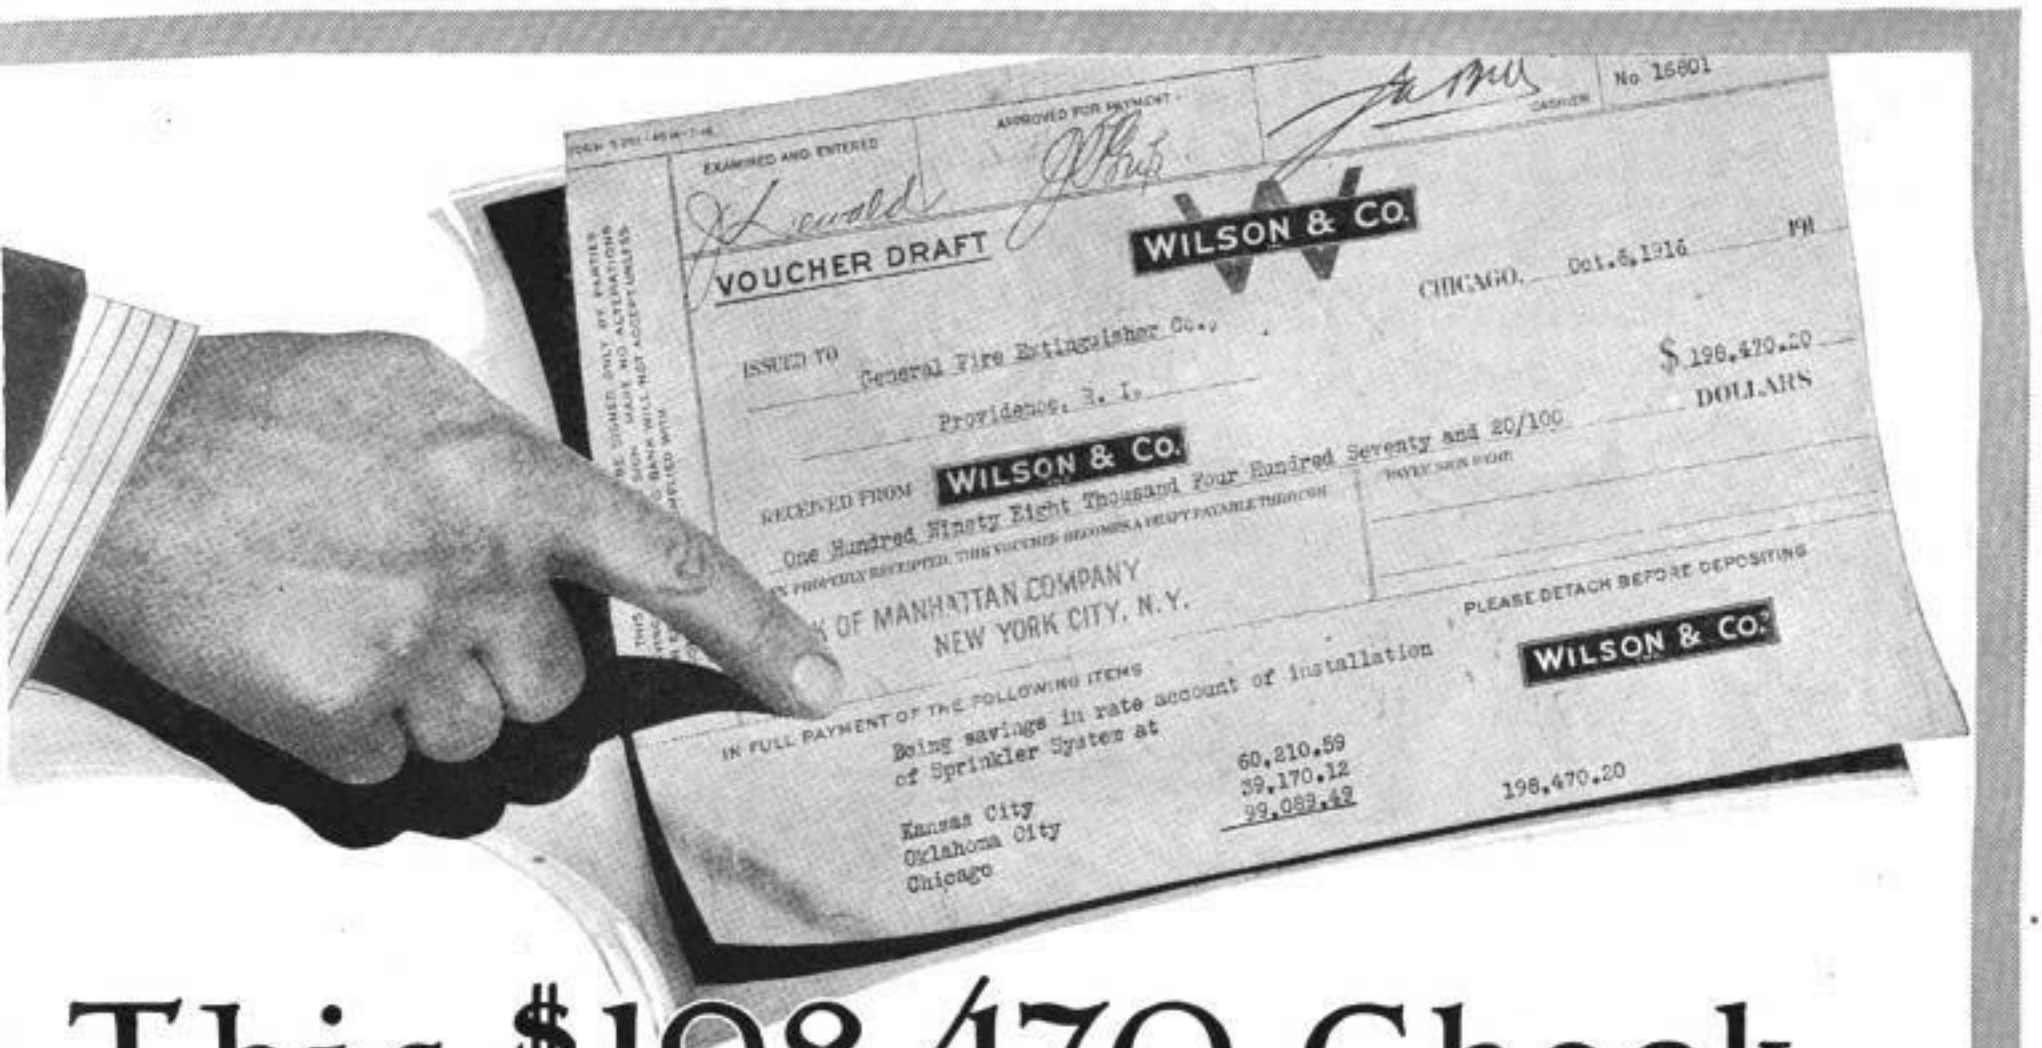
Actual tire trouble is not needed to ruin the pleasure of a motor trip—the fear of it works almost as damaging an influence.

And the fear of it springs from what? From the thought that the single spare or the pair behind *may* not fully outrank the chances of accident.

This fear is banished from the car that carries a Goodyear Tire-Saver Kit.

For this Kit prepares the driver against any tire accident short of complete ruin.

It is handy, compact and complete, and the only package on the market containing all essential first-aids-to-tires. It contains tire putty, self-cure tube patches, inside and outside protection patches, cement, talc, friction tape, valve parts, pressure gauge and so on—everything needed in the emergency.



It perfects your pleasure in your car, and its cost is trifling in view of the peace of mind it brings.

Goodyear Tires, Heavy Tourist Tubes and "Tire Saver" Accessories are easy to get from Goodyear Service Station Dealers everywhere.

This $198,470 Check

Wilson & Company's First Annual Sprinkler Saving

Mr. Thos. E. Wilson, President of Wilson & Company, the great packers, wanted the best possible safeguard against having their $150,000,000 a year business interrupted and disrupted by a fire.

He found that Grinnell Automatic Sprinklers would reduce the average insurance rates on his packing plants 85%.

His shrewd business judgment told him that the insurance companies could not afford to make such a sweeping reduction unless the fire danger in those plants was going to be practically wiped out by the Grinnell installation.

Forthwith, he contracted to have Grinnell Automatic Sprinklers installed in all the large plants of Wilson & Company.

As the Grinnell Systems were completed, the new low insurance rates went *immediately* into effect.

In the Kansas City, Oklahoma City and Chicago plants the Grinnell Systems have been installed a year.

The above check for $198,470 shows the first year's saving in insurance premiums to Wilson & Company on these three plants alone, which sum was also their first payment to us.

These savings will come annually.

In less than three years the insurance companies will thus repay to Wilson & Company what it cost them to protect their business against fire.

When the other plants are equipped, Wilson & Company's annual insurance savings will be proportionately increased, and in a few years an annual insurance saving greatly in excess of $200,000 will be entered on Wilson & Company's books as "all profit."

Many concerns can make the same ratio of saving as Wilson & Company even though their insurance premiums are as low as $500 a year and, what is more important, secure the same measure of protection.

If you have the slightest doubt about *your* being able to make a substantial saving, write to us.

In case you cannot spare working-capital, we can give you the names of reputable concerns who make a business of accepting insurance savings as partial payments for a sprinkler system. This plan not only safeguards your working-capital from the calamity of fire, but also, practically with no investment, adds a Grinnell Sprinkler System to your real estate assets.

Your big American business man is in love with his business. He believes in keeping that business going, not chancing it in a fire.

Why not take a leaf from the books of the wisest business concerns in America, and get in touch with us to determine quickly the cost of protecting your *going* business? Address the General Fire Extinguisher Company, 277 West Exchange Street, Providence, R. I.

The feeding stuffs tempted the peas-d milk to his young stock. Grain supposed to go to the milch cows n to beef cattle. It is clear, how-at the prevailing prices of milk it was more profitable to convert at than into milk; and we may be this was done. The low ration of flour resulted in a larger consumption of milk by the peasant class. The high prices of butter induced the peasant to produce butter rather than sell milk.

Gradually the price of milk at retail was raised from five to eight cents a quart. Nevertheless, increase of price did not bring increase of production. During the winter months the public was urged to be patient until the coming of spring, which would yield the green fodder on which the freshened cows would again produce satisfactory amounts of milk. The spring came, but with it little increase in milk. The cows had calved in such poor physical condition that when the new fodder became available the excess of intake over maintenance went to restitution of lost tissues and not to increase in the flow of milk.

Just at this time the use of crude sugar was prohibited, potatoes were becoming scarce, and grain also; and there was no relief. With the advent of spring the cows of the peasant were placed at work, since the scarcity of horses and work oxen made this necessary. Emaciation of the cows, subsistence on green fodder and subjection to hard work in the fields were not conducive to a large yield of milk; only a low production of milk could be expected and nothing else materialized. These considerations did not apply to the large dairies; but the large dairies lacked concentrated feed.

Chances for Leaks

Milk cards appeared throughout the spring and summer as local regulations. In September, 1916, the supply of milk was very low—scarcely more than enough to cover the needs of mothers, infants, children and the sick. The rule imposed upon the dealer that he should confine himself to his old customers, and not accept new ones, did not prevent him from practicing favoritism with his old customers; and the instruction of the controller to sell not over one-fourth to one-third of the peacetime amounts could not be enforced, as in the last analysis it had no reference to the size of the household.

The point of failure in the entire attempt at regulation, up to the control introduced in October, lay in the fact that the enforcement of specified use was imposed upon the consumer.

The final system inaugurated in October was founded on four considerations: the milk of peasants and of dairies was separated in the regulations; the use of milk in the household, guaranteed on the milk cards, was based on the composition of the family; the amounts of milk devoted to household use and to the manufacture of butter and cheese were regulated at the source; and the feeding of milch cows was effected by rationing by the authorities. Large dairies are supplied with rations, and must return specified amounts of milk. The small producers' milk was not confiscated. They were advised to use the normal amounts and turn the balance over to the authorities.

Here, obviously, was left unguarded an opportunity for a leak, since the peasant might feed milk to swine or calves. The nonagricultural population has been placed upon a strict milk regulation. During the last three months of gestation, during the period of nursing and period of recovery therefrom, a woman receives one liter of full milk daily. The bottle-fed child up to the second year is to receive daily one liter of full milk; between two and four years, three-fourths of a liter; between five and six years one-half of a liter. After the age of six, no milk ration is guaranteed, but of skim milk the child may receive as much as the market affords.

Full milk is allotted to the sick under the care of a physician. After these amounts have been allowed for, the remainder of the full milk goes to the manufacture of butter and cheese, the skim milk being returned to the market for unrestricted sale.

The medical world expressed criticism of the exclusion of milk from the diet of the child over the age of six. A choice had to be made between the milk needs of these children and the butter needs of the entire population; and the controller evidently reasoned that the child would receive the skim milk, and in their ration their share of the butter. There is little doubt that, under the operation of the present system, the people of the cities in industrial sections receive more milk than they secured during the first nine months of 1916.

The manufacture of cheese was regulated and the total cheese production of the empire, outside household cheese, confiscated.

MY CAR

.o Own a

PER-SIX

lson Super-Six. Ask any r car. You will find the ıs we express in this ad.

was by reducing friction almost to nil that Super-Six gained its supremacy. It is ɔugh the endurance which results that it won amazing records.

The evidence is clear that the Super-Six best luces friction. Until some type excels it in at respect, it holds the leading place. Every otorist must concede that, whatever type he ns.

Not Waste Alone

Much of the power was wasted in the old-type Six. We knew that, as did others. And, like others, Hudson engineers sought ways to correct it. We clung to the Six because this invention made the Super-Six excel.

By saving this waste, we get speed, power and flexibility such as like-size motors never showed before. We get more than you need, or will use.

But we get, above all, endurance. The fiercest strains, continued thousands of miles, have failed to show in the Super-Six the slightest evidence of wear.

We now combine this Super-Six motor with the limit in beauty and luxury. We have added to the car a great gasoline saver. No effort has been spared to make the Hudson supreme in every detail.

It is today the world's great car. And it probably always will be. The Super-Six motor comes so close to perfection that it leaves little room for improvement. And our patents control it.

Its owner knows that it can win in any sort of test. And, above all, in the test of long life.

that expressed price distinctions, but not qualities.

The wealthy devised a pretty scheme to circumvent all regulations. A peasant possessing ten milch cows would sell one to each of ten men of means. Then each would employ the peasant to care for his cow, supplying the fodder, and having the milk and butter delivered to him, claiming exemption as an individual producer. The scheme was expensive; but it provided butter and milk in excess of the allotment of the cards.

With the advent of the new controller all fats were confiscated. The outputs of dairies were exacted on the basis of their milk supplies, and their cattle were rationed by the state. The killing of milch cows was made illegal. The butter cards became obligatory for the empire, and the selection of dealers was made compulsory. During June, July, August and September rations in cities varied from three and two-tenths ounces to four and six-tenths a week. The prices averaged from twelve to fifteen cents for three ounces. Communal authorities seized all butter produced by dairies of over fifty-quarts capacity a day, determined how much should be distributed locally and how much should be sent to the Imperial Bureau for Fat for the Use of the Cities. Peasants were not allowed to sell butter except to the communal authorities and the peasant's butter and milk were both liable to requisition.

To illustrate how hard it is to scotch the peasant, one needs but to state that, in Bavaria, it is contrary to law to sell a centrifuge or churn to a peasant, unless he contracts to sell his butter to the communal authorities.

Substitutes for Soap

The margarine and fats are now distributed by the same organization. The results of the new system have been a marked reduction in prices, but no increase in quantity. During October the usual ration in cities was three and two-tenths ounces of table fat a week; butter, two-thirds; margarine, one-third. The prices were from six to eight cents for two and one-tenth ounces of butter; for margarine, three cents for one and one-tenth ounces.

Lard and tallow are classed either as meats for purposes of the diet or as industrial fats. The cultivation of vegetable fats has been greatly stimulated and the crop of 1916 contained very material amounts of fat obtained from chestnuts, beechnuts, rape, marigold, poppy, sunflower and mustard. Slaughterhouse residues are no longer fed to animals until after all the fat has been extracted.

According to Liebig, the great German chemist of two generations ago, the civilization of a people may be measured by the consumption of soap; and if this dictum be accepted the Germans will have to admit that one other people is more civilized—namely, the Americans. The peacetime production of soap in Germany was some seven hundred thousand tons, ten per cent of which was toilet soap; nine thousand tons of glycerine were obtained as by-product. The per-capita use of soap was a little over twenty-two pounds a year. When fats became scarce in Germany, in the winter of 1915–16, the soap makers were among the first to feel the pinch.

In March, 1916, the soap card was issued. The ration at first was three and three-quarter ounces of toilet soap and one and one-fifth pounds of common soap a month, purchased on the bread card on the twenty-fifth of the month. The use of soaps for common cleaning purposes—steps, woodwork, leather—has been prohibited. Since July the monthly soap ration has been one and four-fifths ounces of toilet soap and half a pound of bar soap. There is now an Imperial soap card, guaranteed and uniform throughout the empire. Special provision has been made to cover the needs of children, nurses, physicians and dentists.

A large number of synthetic cleansing agents have been devised. Some of these, which are entirely free of soap and resemble tooth powders or tooth pastes in appearance, are very effective in the cleansing of the skin, operating after the fashion of almond meal. The scarcity of soap illustrates strikingly the scarcity of fats. When one considers the high value of glycerine to a nation at war, one may be certain that all the fat which can be spared from human consumption and technical uses will be spared; and the soap production becomes, therefore, a reliable index of the availability of fat. *(Continued on Page 46)*

(Continued from Page 43)

The peacetime consumption of meat in Germany was about two and a quarter pounds per head per week, practically double the consumption of a generation ago.

The meat production of Germany was to a considerable extent dependent upon imported foodstuffs. We shall not go far wrong if we assume that the fat concentrates were devoted to milk production and the grain concentrates to meat production. If the data of the total fodder consumption and imported feeding stuffs be contrasted, and evaluated according to the rules of scientific stock feeding, we learn that approximately one-quarter of the meat consumption of Germany was derived from imported feeding stuffs. The meat production of Germany had long been upon an efficient plane, as the livestock yielded annually over half their weight in market meat. Germany also imported meat and meat products, and especially fat.

Following the recommendation of the Eltzbacher Commission, one-third of the swine were slaughtered late in the winter of 1914–15; presumably between six and seven million swine were killed. During this winter there was undoubtedly an unusual consumption of meat. Of the conserved meat, which should have been available for reserve for the ration of the following year, a great deal was lost by decomposition; so that, beginning with the autumn of 1915, the meat consumption was reduced to the plane of meat production, and this was low, because the fodder and grain crops of that summer, with the exception of potato, were far below normal.

According to the plans of the scientists, the number of head of domestic animals was to be kept down to the available fodder. When, in the fall of 1915, the available feeding stuffs were recognized to have fallen far below the plane of the number of animals, a second slaughter should have been decreed. If the slaughtering of animals was necessary in 1914–15 it was doubly necessary in 1915–16. Now this did not meet the views of the agricultural population at all. They wished to nurture their stock in order to restore their possessions and stand equipped, ready for the return of peace, which was regarded as certain to come within a year.

When Meat is Not Meat

If the peasant fed up his young stock this could only be done at the expense of proper feeding of the milch cows and by the utilization of potatoes, sugar beets and molasses; to some extent also of grains, the feeding of which to stock was prohibited. All of these the peasant did feed, with the aim of restoring his count of livestock.

During the winter of 1915–16 a great deal of meat was requisitioned for the army. The peasants killed many animals in domestic slaughtering, consuming the meat themselves outside of all control and dispensing large amounts outside the channels of trade, to people living in small towns and in the large cities. Under these circumstances the stock in the best condition was killed. There was not enough feeding stuff to maintain all the animals in reasonably good condition; therefore, the remainder of the stock was carried along on what was little more than a maintenance ration.

When the cities, buying through the channels of trade, went to the country for livestock they could secure only cattle and swine of low grade, thin even to emaciation. Such animals yielded little meat and when placed upon the market did not suffice to meet the demands. Thus, with each month following October, 1915, the scarcity in meats became more and more pronounced. There was little or no meat procurable by importation during the winter of 1915-1916; certainly not over one hundred thousand tons, as meat was scarce both in Holland and in Scandinavia.

Local meat cards appeared in various portions of the empire late in 1915 and became universal in the cities early in 1916. Two meatless days were established—Tuesday and Friday. There was little control in the country districts or in small towns that could secure their supplies through personal dealings with the growers. The country districts made the exportation of animals and meat products to the cities directly and indirectly difficult or impossible. Maximum prices were placed on certain meat—pork—which had the simple effect of driving that meat from the market and inducing others to appear at higher prices.

The situation was, of course, taken advantage of by manipulators, with the result that the rich secured the meat and the poor in the cities had practically none. In the cities there were fine distinctions as to when meat was meat, and when it was not meat. Thus, loin of veal was meat; but tongue and liver and tail were not meat.

In March, 1916, the open market for cattle was practically empty and the provisioning of the cities with livestock was placed under regulations. The cities contracted with livestock associations to furnish so many head a week. Thus, Berlin, in peacetime, consumed one hundred thousand swine a month. In April fourteen thousand swine were ordered to be purchased for the city markets; only twenty-three hundred were secured. The simple truth was that the swine were not fit for slaughter. The cities had no power to confiscate the animals.

Conditions in South Germany

Meantime, in South Germany, the meat cards provided for one and a half to two pounds of meat a week. The cities attempted to meet the situation by buying their stock directly. Failing to obtain stock fit for slaughter, as early as May they began to buy lean stock; and, securing supplies of feeding stuffs, proceeded to prepare the animals for their markets. These meats went largely to the poorer classes.

For example, in May, 1916, four hundred thousand swine were purchased by the city of Berlin, to be used as feeding stock. The cards throughout the cities, from January to May, called for from one-half to one pound a week. The amount of meat available was so small that only a small percentage of the buying public could secure meat, and the average weekly ration in many cities in the spring months was not over three-quarters of an ounce, and this on paper.

In May conditions became so bad that a uniform card regulation was attempted, and this was elaborated when the new food controller took charge. Each householder had to select a meat dealer. The central slaughterhouses and the wholesale buyers were eliminated. The cities sublet contracts for slaughter and delivered the meat directly to retailers, who obtained meat in return for retail cards turned in by them. The amount stated on the cards was reduced to nine ounces a week. At this time the meat ration in the army was reduced to three-quarters of a pound a day, with two meatless days a week for soldiers not on active duty. The card system at this time was necessarily a failure because the amount of meat available was so much smaller than the amounts called for by the cards.

In June a survey of the livestock situation convinced the authorities that it was useless to attempt to increase the ration. The plan was then formulated to keep the ration low and feed up the younger stock, with the intention of increasing the meat ration in the autumn. Practically speaking, conditions in the summer months remained unsatisfactory from every point of view until the Imperial meat card was issued in July. This accomplished more equitable distribution of meat; but the ration remained very low. In August pork was practically withdrawn from sale. A survey of the rations of the different cities of Germany during the summer months indicated that the individual allotment secured each week was not over one-third of a pound.

In September the final system of the war nutrition department was put into effect. The essential feature of this system was the confiscation of the livestock and the control of the feeding of this stock and its delivery to the market, precisely comparable to the system described for the dairies. The livestock remains in the physical possession of the peasant, but the use belongs to the state; the state furnishes the feeding stuffs, allots to the peasant a certain fraction of the meat, and claims the balance for the nonagricultural population.

One concession was made to the peasant which, it was fully realized, carried grave dangers: the peasant was permitted to slaughter stock for his own use, but was supposed to kill such animals as gave a meat ration comparable to the meat card of the nonagricultural population. There is good evidence that this concession was being widely abused in the early months of the autumn of 1916; and, indeed, nothing else was to be expected.

Looking back over the nine months preceding the introduction of the Imperial meat card, in September, 1916, one may concisely describe the situation by saying that the

ble that the final struggle be-
ific control of the food supplies
-interest policy of the agrarians
nd. Last year the industrial population went on short rations. This year it must be the livestock alone, or German efficiency has gone to wreck.

The use of poultry in Germany was restricted practically to the well-to-do classes and the accentuated scarcity of poultry, with its higher prices, concerned them alone. On the other hand, the reduction in the supplies of fish affected the common people. From one-half to two-thirds of the supply of sea fish in peacetime was drawn from waters that are now more or less closed to German fishing. Importation of fish from Holland and the Scandinavian countries was extensive until the pressure of the blockade forced these countries, first, to reduce the scope of their fishing operations, and, second, to prohibit indirectly or directly the sending of fish to Germany.

Under these circumstances the sea-fish supply was much reduced during the summer of 1916. The German catches of Baltic and sweet-water fish were increased. The higher grades of fish were consumed by the well-to-do in peacetime, but the cheaper grades of fish formed a staple in the diet of the working people. These cheaper grades of fish, both fresh and smoked, are now expensive. Herring were so cheap in peacetime that they were used as fertilizer; now the prices on the coast range from ten to twenty cents a pound.

A Reduced Beer Supply

A survey of the fish markets and of the reports in the trade papers confirms the opinion, expressed in the daily press, that the total fish consumption during the past summer was probably not much lower than in peacetime; but that the distribution was different, since fish went to replace meat in the households of the well-to-do and middle classes. The supply of fish during this winter must be very much reduced, since the sweet waters now furnish very little; and even in peacetime the salt waters furnished in winter much less than in summer.

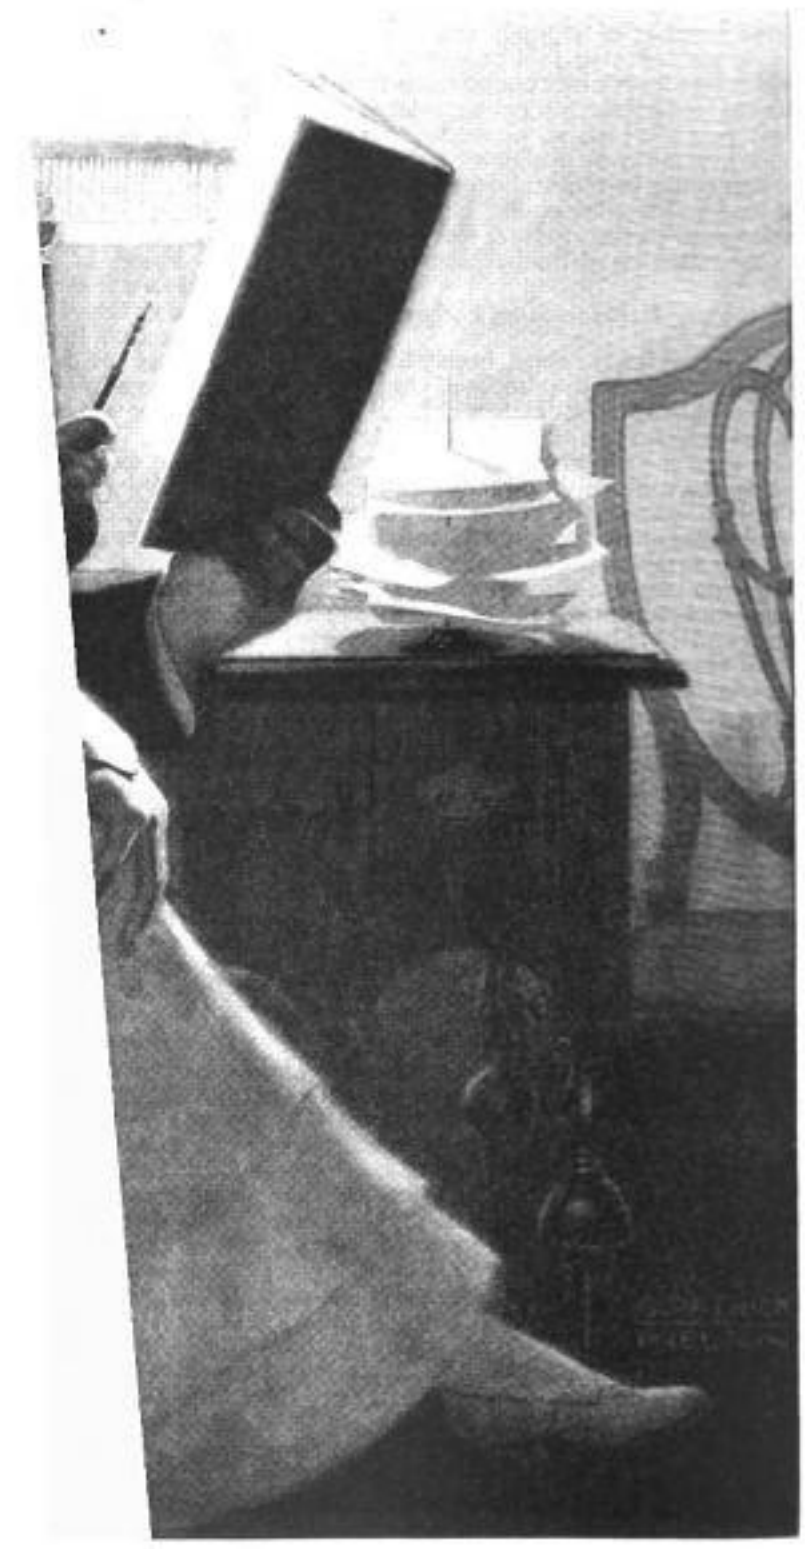
In the years directly preceding the war the consumption of alcoholic beverages by each person a day in Germany was seven-tenths of a gallon of beer, two hundredths of a gallon of spirituous liquors and three-hundredths of a gallon of wine. Some thirteen per cent of the beer was made from imported barley; half of the wine was imported. The per-capita consumption of alcohol yielded one hundred and ten calories daily—between four and five per cent of the total intake in calories. The Germans ingested more calories in the form of alcoholic beverages than in vegetables and fruits.

Reduction in consumption of alcoholic beverages was determined upon early in the war, but really carried into effect only after the low harvest of 1915. The alcoholic beverages contain but a small fraction of the protein and calories of the grains from which they are manufactured; the protein is entirely lacking in spirituous liquors. Entirely apart from questions of the effects of alcohol, restriction in manufacture was necessary to minimize loss in grain and to reduce the labor required in the processes of manufacture.

That the prohibition of vodka was necessary in Russia was regarded in Germany as evidence of the lack of civilization in Russia. The amount of barley that could be devoted to the manufacture of malt was reduced to sixty per cent; grain devoted to whiskies was understood to have been reduced one half. More recently the making of grain whiskies has been interdicted. The importation of French wines apparently continues; otherwise there must have been immense amounts stored in Germany, for these wines are everywhere to be had.

The hours of sale and the amounts allotted for daily sale were fixed differently in different parts of the empire. In Berlin limitation was by hours; in Munich limitation was by quantity—so much for each resort for each day. In the summer of 1916 sophistication of the beer by addition of saccharine was first permitted; later it became compulsory. This adulteration has been resented by the people, as saccharine almost ruins a good beer.

Abuse of alcoholic beverages was very rarely observed by the writer during the months he was in Germany, moderation being due largely, he is convinced, to the restraint imposed by the psychology of war and to preoccupation with work, thus indicating again that alcoholism results from idleness rather than from overwork.



Editor's Note—This is the second of three articles by Doctor Taylor. The third will appear in an early issue.

eōlin—our wonder-
le of wear

iscouraged, my wife and I, listening to the pounding of the ; feet—thinking of the monthly shoe-bills which seemed to set ? sacrifice of ours at naught.

iscouraged, my wife and I—I, foot-weary from the busy office, all the foot-miles of her household tasks. And then I spoke:

there were but something BETTER THAN LEATHER— g that would wear better and be more foot-comforting."

'le did we know that even at that moment Science had ' something far, far better than leather—better feeling, better IG, and with looks that match its wear!

* * *

:hs after, I made my great y.

:ked up a shoe idly from lay on a shoe-store shelf. beautiful shoe, styled and

)out the sole was some- well, *modern* would be the think.

I saw a Neōlin Sole. The)ment I had tried it. That : was a memorable one for)r flexible and foot-easing was, and soothing as a from the first smooth step!

at was but the beginning onderful Neōlin experience.

day by day and month by wore my new Neōlin Soles, :asing wonder came. They 'earing as no other shoe- ıd ever worn. And then—!

my wife wasted not a ıt! Neōlin looks had al- won her—and now that wear and comfort were facts, there was nothing but Neōlin Soles for the family!

Yes, life is somehow different since Neōlin came—and we thank Neōlin for that. Since then the shoe-bills have hoisted a permanent relief sign, and Willie and Margaret and Dorothy can play and jump and pound, and, bless you, we won't worry. Isn't Neōlin there to wear and save? Yes, and to do far more than that:—

For Neōlin saves the doctor bills as well through snug-foot, waterproof tread—and we just thank it again for that.

Wouldn't *you* thank Neōlin, too?

* *

Neōlin is for new shoes or new soles. It comes in black, white, tan; and your shoe-dealer or repairer probably has it. If not, *insist* and both will get it next time. Remember, it costs no more. And its quality is always the same on any price of shoe. To avoid the imitations—*mark* that mark, stamp it on your memory: Neōlin—

innon Monroe

ILLUSTRATED BY FANNY MUNSELL

the new scheme pretty well worked I asked. He looked quickly round. nen had just taken the seat behind us. he thing's all blocked out, and that's iggest part," he said in a low tone. He ed at his watch. "We can't talk here, there's a man I've gotta see before he off. I won't wait for you in the mornin'. ne to the office as early as you can, and ll go into everything root and branch."

The first whiff of the office air reminded e that as partner I now had a voice, and I stantly determined to raise it in the cause ventilation. A hundred typists were icking away for dear life in the large oper- ting room. Miss Krog, the handsome blond orewoman, well tinted and tailored and more of a presence than ever, was showing a new girl how to fill in lines on follow-up letters. The same old bookkeeper was busy in the cage, her swarthy, heavily lined face bent over her books, and her big, intense black eyes peering through ugly, horn-rimmed glasses, fairly daring a figure to get away uncounted. The private office was neglected and ill-kept, though sturdy William, the bullet-headed office boy, had evidently attempted to bring about a semblance of order on the surface of things.

Apparently I was not expected. Miss Krog's expression changed to frowning surprise when she saw me—I caught the antagonism before she could mask it; then she came over to shake hands.

"Glad to see you back," she said in a low, constrained voice.

The bookkeeper left her cage.

"Where you stopping?" she demanded in an inquisitional tone.

"At the Harrington."

"Umph! I looked there once."

William stopped his dusting, rubbed his hand on his trouser leg and thrust it out to be squeezed. He didn't say a word, but there was heart in William's greeting. Each went quickly back to the tasks that had been interrupted. The dull, heavy atmosphere of the great barnlike place contrasted drearily with the remembered brightness of my own snug little office in the West. I had forgot the cold, machinelike inhumanity of a large office. I suddenly wished with all my heart that it would prove a dream, that I would wake up presently and find myself back at my own quiet desk, where business was human. How many times in the next months I was to repeat that wish! Had I imagined then what was ahead of me, I would have taken the first train out of the city.

While I was hanging up my wraps Mr. Bittner came in, spoke to Miss Krog, nodded to me, and went directly to his own much-hacked, flat-topped desk and began to open mail.

"That un's yours," he said, jerking his head toward a handsome new mahogany desk in the lightest corner of the private office.

I went to it, pleased in spite of myself with this compliment to my taste—it was the only good piece of furniture about the place. Further than that, deep down inside I was thrilled by this demonstration of the will and determination of the man. He had bought the desk before leaving for the West, not doubting that I would return with him. I felt once more that peculiar sense of certainty that whatever he ordained would eventually come to pass. And with the feeling the thrill of adventure returned and for a time banished regret. I sat down at the desk, rolled back the top and began to investigate the little pigeon-holes and drawers.

Bittner Goes on Record

Mr. Bittner came over and placed a bulky package before me, then he drew up a chair and sat down. At last I was to hear all the details of the big new scheme.

"First off," he began, squinting up over his carving, "we gotta get rid of our rivals."

"I thought this was wholly new, without rivals!" I exclaimed, dropping back in my chair, disappointed.

He gave me one of his steady sidelong looks, then went on: "Before a new business is dry from the shell the come-ons are ready. We gotta put up bars as fast as we travel—bars that'll be hard to get over. I want you to write a complete history of the beginnin', growth and development of the new scheme. Give the date of its startin'—now; the name of the founder—me; the purpose—to make and place business men; and then tell what it's done in the way o' wakin' up American men and puttin' 'em right with themselves and business. State it clear that it's the only enterprise of the kind in existence. After the scheme is goin' good, carry this history over to the State Historical Society, have it filed, and get a receipt for it that will read like this:

"'Received and filed by the State Historical Society a complete history of the founding of the first enterprise in existence for the making and placing of business men.'

That'll be the first bar for the imitators to get over—that record provin' that we are the first. Then there's one more bar: I gotta get recognized in some public way as an authority on business; but I ain't got that figured out yet; and ——"

"Mr. Bittner," I interrupted, "you are! It's perfectly wonderful how all over the West business men defer to the Bittner & Binks books."

"It's gotta be in shape so's they can see it, like a label or a blue ribbon put on at a fair. But that can wait. You go ahead with the history."

So often I find that a lack of understanding in the accuser is the fault, rather than a fault in the accused.

I was soon ready to begin dictating the rearranged pages, and I asked Miss Krog, who had held aloof ever since my return, for her best stenographer. She thought a moment.

"I'll give you Gladys Howe," she said. "I find her very satisfactory."

I must confess that I doubted Gladys when I saw her coming. She was a lumpy sort of a girl, with blond hair falling over her eyes, fat arms and neck emerging from a blouse known as "peekaboo," fat hips that wabbled and large feet that overran her shoes. Her face was rather pretty, in a baby way, and she appeared amiable. She sat down by my desk and opened her notebook. Her nails were not nice, and she heaved in a short-of-breath manner as though her clothes were too tight for her.

She seemed to take her dictation readily, however, and I made up my mind to overlook her untidiness; but during the remainder of the day I paid for her readiness. Half a dozen times she came to me to get her notes straightened out, and frequently I had to redictate. She had probably done very well for Miss Krog, whose dictation varied little, day after day, and always concerned the business books. Gladys had achieved Miss Krog's vocabulary. But the work I was doing was of a different order and required a much larger vocabulary. Gladys didn't have it.

Gladys and Her Beau

I went to Miss Krog: "Can't you get me a better stenographer?"

She lifted her handsome eyes in a questioning way that put me all in the wrong. "That's very strange," she said icily. "Gladys does my work very well. I gave you the best girl I had."

I decided to try her a while longer. The next day, in smiling good nature, Gladys took her place. I dictated more slowly this time and had her read each paragraph back to me. I spent the forenoon dictating matter that I could have given to a competent stenographer in a couple of hours. But when she brought me the transcribed pages late in the afternoon they were full of errors. She had written "act yes" for "acquiesce," and said an "author" had expired when I had dictated "offer."

"Gladys, did you really think I dictated 'author'?" I asked. "It doesn't fit in with the context in the least."

She looked blank and ceased chewing gum for a moment.

"I didn't think," she said, blushing.

"Try thinking to-morrow."

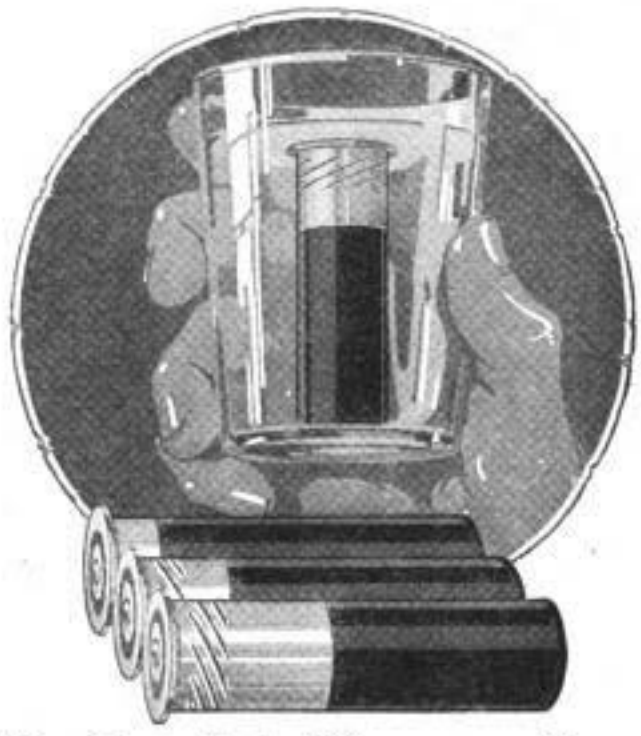
I really did my utmost to get along with Gladys, as I could see plainly that Miss Krog did not intend to brook interference in her department, and she had always engaged the employees. She resented any criticism of a girl that she had hired as a criticism of herself. Miss Krog did not seem fully to understand my new position with the firm, or else she preferred to ignore it. Undoubtedly it was hard for her to see another woman in more confidential relationship with Mr. Bittner than herself, when she had been with him for so many years.

She had grown up with the business and she may have hoped some day to be given an interest in it. But Miss Krog had not grown beyond the business—that is, she merely kept up with it. She was an excellent forewoman, but that was all.

I foresaw trouble should I interfere with her in any way, so I determined to be as tactful as possible. The situation was a fire all laid, ready for the stroke of a match. I would not be the one to light the match. Day by day, however, Gladys became more irritating, and in spite of my good resolutions I decided I should have to get rid of her. However, an amicable way of doing so presented itself.

"What is that ring you are always twirling?" I asked one morning as she sank like lead into her seat.

"My engagement ring."



"When are you to be married?"

"I'm not giving notice," she said. "I'm working to get my wedding clothes."

"Is he a good man, Gladys?"

"Oh, yes! He gets eighteen a week and often overtime. He's a printer."

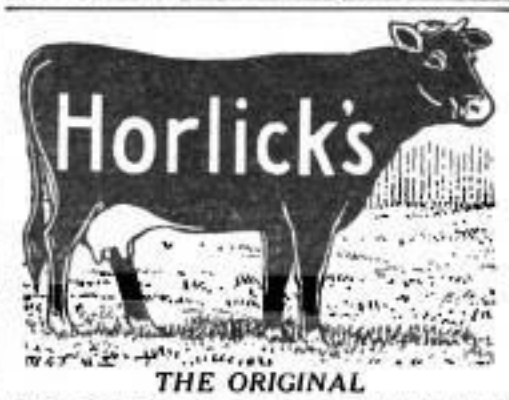
"Then why wait? Isn't he ready?"

Have You Tested the Waterproofing of Your Shot-Shells?

Will the shells you now use soften and swell when they get wet? If they do, what's going to happen some day when you strike a leaky boat or get caught in a down-pour?

Put a Black Shell into a glass of water for half-an-hour. Get it wetter than you'd ever actually get your shells. You'll find it still chambers and ejects as well as if never wet.

It's a good thing to know how much soaking your shells will stand.



US THE BLACK SHELLS

Smokeless and Black Powders

Ask your dealer for The Black Shells. If he hasn't them, mail $1.25 to our nearest selling agent to pay for a box of twenty-five and they will ship prepaid. Be sure to specify gauge and details of load. This is a trial offer and holds good only in towns where The Black Shells are not now sold.

"Oh, yes, but I want lots of pretty clothes."

"That is foolish, Gladys. You get married right away. This office will ruin your looks, and a girl's looks mean more to a man than her clothes."

She slapped a pudgy hand to her plump cheek. "He said I was losing my color. To think you noticed it too!"

"Get married, Gladys; that's the best thing for you to do."

Several mornings later she came to my desk, blushing: "We're going to," she whispered. "I'm leaving Saturday."

I closed my eyes to the sloppy, untidy wife she would make, and encouraged her to go ahead. Maybe the man wouldn't mind. She was lovable in an easy-going, good-natured way, and men prefer lovableness to efficiency in their wives, if they can't have both.

So passed Gladys. My next stenographer, Miss Douglass, was a horse-faced girl with eyes high in her head and fingers of steel. Miss Krog sent her in for me to test before hiring her, and I found she read her notes easily. She demanded—and got, as I upheld her—ten dollars a week. I simply could not spend so much time correcting work and searching my vocabulary for simple words. Miss Douglass showed no matrimonial symptoms in the way of a ring. She was neat and orderly and always on time. That problem seemed settled, provided she did not insist on a raise too soon. It is only the inefficient women who reduce wages. The efficient ones demand and receive pay commensurate with their abilities. The great mass of drifting, unambitious girl workers, who are merely doing time till some man makes it possible for them to "quit workin'," have established a wage that just about measures their worth. Their standard need not frighten a girl who is ambitious and really tries; who brings a brain as well as fingers to the typist's job.

When I was not busy with my stenographer I was usually working with Mr. Bittner. He put himself into the Fifty Principles with a fierce, constant, burrowing force that sometimes startled me, so determined did he seem to wrest from life and experience every particle of business value. Once when I suggested that he let well enough alone, as the course as we now had it was sufficiently unique and thorough to please American business men, he came back with:

"You're forgettin' Borrige & Kemp!"

Hated Rivals

Borrige & Kemp, I had discovered, were the particular rivals that Bittner feared in his new field.

I laughed outright. "Aren't you a bit dippy on that firm?"

"I'd be dippy to forget 'em," he returned with a snap of his jaws, and I said nothing more. This was one subject about which there could be no levity.

At the end of three months I again suggested that we begin to advertise the course without waiting to finish it. I was confident of success, and Borrige & Kemp had pushed the business-book advertising to full pages in all the leading publications, again cutting the price. We had been compelled to do the same, thus increasing our expenses while decreasing our income. The book business remained steady, but it did not grow, neither did we get the high class of buyers that had once been Bittner's pride.

"We'll have our hands full after she's rigged," he said, "commandin' her and keepin' her off the rocks. She's gotta be finished to the last ounce o' paint before she's launched."

"Mr. Bittner," I asked one day, "did you ever fail in anything you set out to do?"

"No man can keep on doin' things rapid, one after another, without succeedin' sometimes and failin' sometimes," he said. "If you think the successful men always succeed, just get a searchlight on their careers way back. It ain't a failure that ruins a man and it ain't a success that makes him; it's never campin' by either."

At last the entire course was in readiness, and I determined to hustle the final copying through and get it to a printer as soon as possible, so that Mr. Bittner would have no chance for further changes. I asked Miss Krog to get me a good copyist, for I had decided that I would put two girls on the work.

"I'm advertising Sunday," she said shortly. "I can't spare another girl now from the operating room."

Monday morning Miss Krog was detained at home by a sore throat, and Mr. Bittner

What Do You Do When Your Pipe Gets a Grouch?

"That pipe and I had been friends for years," remarked a pipe-smoker, pulling out an old scorched briar. "Then of a sudden something went wrong. The pipe got a grouch.

"I tried so many cures, my wife started making fun of me. Finally I gave up and chucked the old briar into the ash pile—covered it up with every shovelful of ashes I could lay my hands on.

"For two months after that it was one thing after another—new pipes, cigars, and even cigarettes. Between them all I managed to forget.

"But one day a couple of weeks ago I was down cellar brushing up when I thought of my old pipe. Do you know, I dug down in that ash pile like a dog after a bone. And I got it—caked in damp ashes and the color of a wet piece of iron.

"Williams came over that night and I brought out the relic.

"'Fill her up with my Edgeworth,' he suggested, handing me his blue tin.

"For a moment I smoked—just deciding what the result was. Then Williams saw the grin that spread over my face. How could I help it? Imagine how it felt to get back to that sweet, satisfying old flavor again, and better now than I had known it before.

"So that's my remedy for a grouchy pipe. Throw it in the ash pile and let it stew for a couple of months."

Now, Williams has another side to this story. He claims it was the Edgeworth that gave that glorious flavor and not the pipe at all.

We won't attempt to decide this for you one way or the other, except to say that Williams has been smoking Edgeworth for years and his word ought to carry some weight. And, we might add, the man who told this story has used it ever since.

Anyway, Edgeworth Smoking Tobacco makes a friend or two wherever it goes—mostly among fellows who take pipe-smoking rather seriously.

You perhaps have never smoked Edgeworth. We very much wish that you would try it and will very gladly send you enough for several smokes, free. Just drop us a card bearing your name and address, and the name of a dealer from whom you buy tobacco.

Edgeworth comes in two forms, Plug Slice and Ready-Rubbed. It's the same tobacco in both forms, but Plug Slice is prepared for the pipe by the smoker, who "rubs it up" in the palms of his hands. Ready-Rubbed is, as the name suggests, all ready for the pipe. You may have a sample of both and decide for yourself which form suits you better.

The retail prices of Edgeworth Ready-Rubbed are 10c for pocket-size tin, 50c for large tin, $1.00 for handsome humidor package. Edgeworth Plug Slice is 15c, 25c, 50c and $1.00. Mailed prepaid where no dealer can supply, but except in a few isolated cases all dealers have it.

Write to Larus & Bro. Co., 1 South 21st Street, Richmond, Va. This firm was established in 1877, and besides Edgeworth makes several other brands of smoking tobacco, including the well-known Qboid—granulated plug—a great favorite with smokers for many years.

To Retail Tobacco Merchants: If your jobber cannot supply Edgeworth, Larus & Brother Co. will gladly send you a one or two dozen carton of any size of the Plug Slice or Ready-Rubbed by prepaid parcel post at same price you would pay jobber.

asked me to go to the reception room and choose some girls. It seemed that we needed an assistant for the bookkeeper, Miss Lutkins, and several typists. I was glad of this opportunity to choose for myself, for I wanted an especially quick, accurate copyist to put on the Fifty Principles with Miss Douglass.

I found the usual throng of applicants and everyone went to my heart, but I couldn't help looking among them for the especially appealing case. I found two. Miss Carrel was a small, emaciated person with a pale, anæmic face out of which burned eager eyes. When I sent her to the table to fill out a blank I discovered that she was also lame. That decided me on the spot. I couldn't send such a girl traveling farther until I had proved her inefficiency. I was delighted to find that she was a rapid copyist, that she had done manuscripts for authors, for this made her just my girl. She was thirty, but she had never worked in an office before. The other girl, Blanch Booth, was too pretty to go around to men's offices looking for work. I still think she was one of the prettiest girls I ever saw—slender, with a beautiful supple figure and patrician bearing. Her features were almost Greek and her fairness made everyone else look dingy. Fortunately she had studied bookkeeping at a business college, so I engaged her to help Miss Lutkins. She was only nineteen and this was her first job. It was well for her to begin in an office made up so largely of women. The other applicants were not unusual in any way.

I took Blanch to Miss Lutkins.

"Here is your new assistant, Miss Booth," I said.

"What?" Miss Lutkins' hard, harsh "What" always made me think of a flat-iron coming down on a delicate shirt front. It was fairly slammed at the person who addressed her.

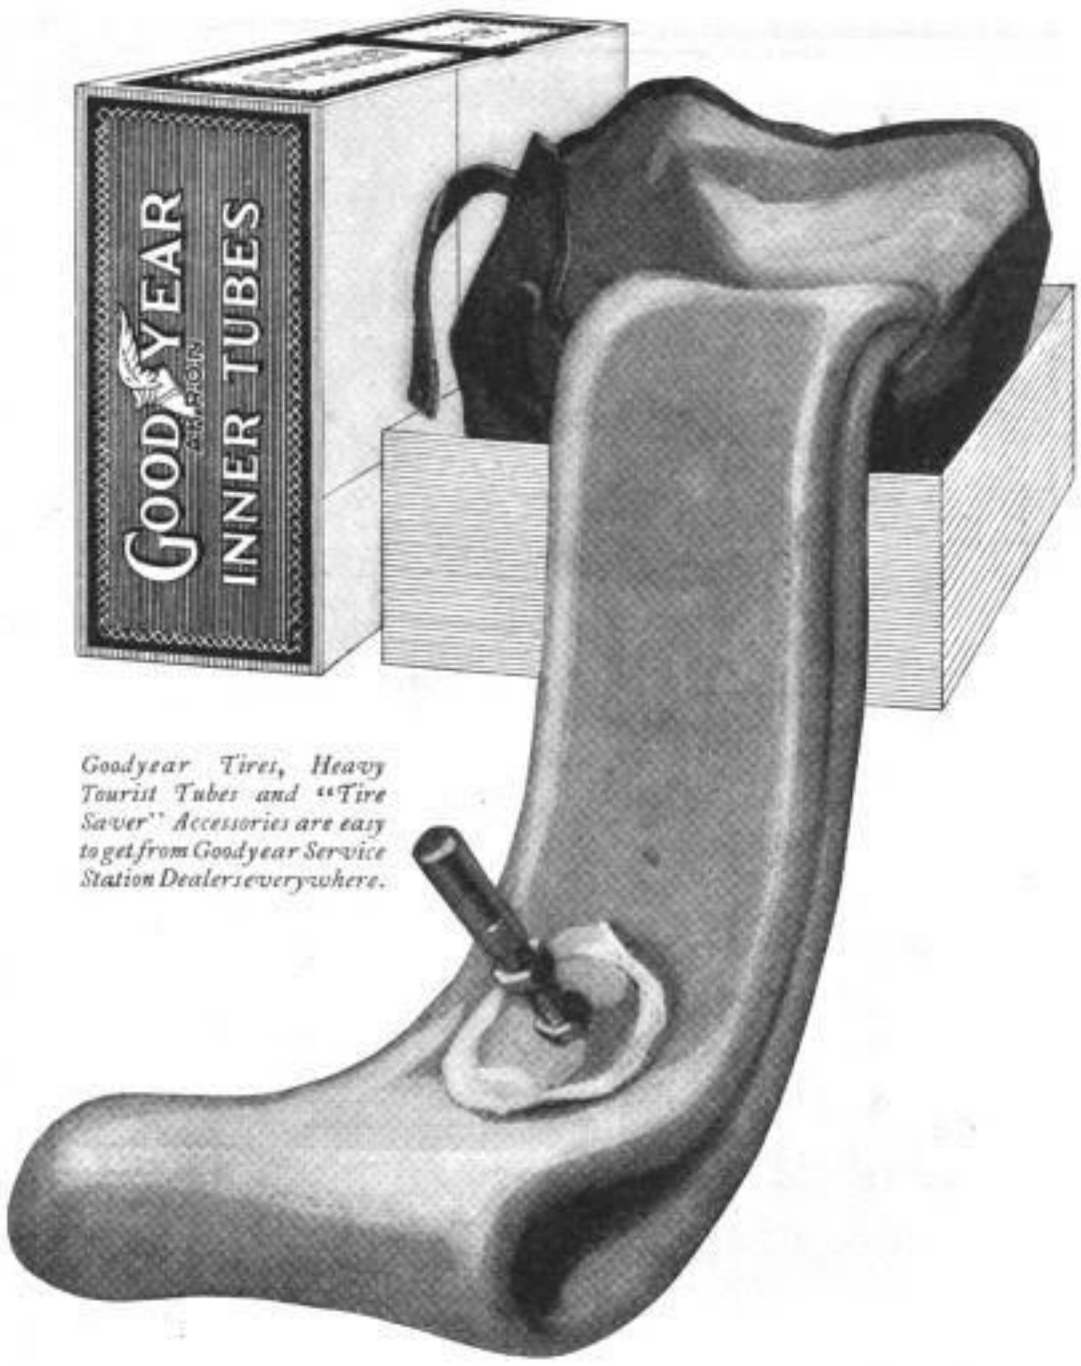
"Miss Booth," I repeated.

Bold Advertising

"Well, put up your things and get busy. There's plenty to do." She again riveted her eyes on her figures and I showed the young girl to the cloakroom. Then I installed the new typists, and returned to the private office where Miss Carrel was waiting. She looked up and smiled so happily and humanly that I was won to her all over again. I had William fix her up a desk near the private office, so that she would not have to walk far to consult me, and then I explained her work.

From the first she was on the job every minute. The way the pages flew from the typewriter under her nimble fingers was a delight. It put new vim into the office force. At noon she sprang up from her desk and hurried over to the reading table where we put magazines for the girls' use. She picked up a business publication.

"May I carry one home to-night?" she asked. I sat watching her.



"Yes, indeed. Bring it back, that's all."

Then she hurried out of the office, dragging her poor lame leg pathetically.

She was late that noon, and I was sorry. I wanted her to be the ideal business girl. But I said nothing about it. Probably it wouldn't happen again—she was new to business rules.

With the two girls working steadily and both of them rapid, the Fifty Principles' typing was soon finished and the manuscript sent to a printer. The next work on hand was the writing of the advertisements. They were subjected to the same tests of writing and rewriting as the Principles. We planned a three months' campaign, during which time we were to spend thirty thousand dollars on space. Had the firm of Bittner & Binks been less well known and without persistent rivals, we should have had a less expensive try-out; but in the face of all the advertising the firm had done during the last six years and with the necessity of springing the scheme full-fledged on Borrige & Kemp, it would not do for us to be niggardly. We must show confidence in our own commodity. This did not really mean a heavier advertising appropriation than usual, however, as we intended to substitute the Fifty Principles for the business books. Not even the advertising representatives knew that a new scheme was in the air. No one had been taken into our confidence—even Miss Krog supposed we were working on another book—so great was Mr. Bittner's fear lest the plan get abroad and reach the ears of our rivals.

The catalogue was an achievement in itself. It was of regular book size and form,

Goodyear Tires, Heavy Tourist Tubes and "Tire Saver" Accessories are easy to get from Goodyear Service Station Dealers everywhere.

It Means More Miles To You

Experts contend that 30% of all tires wear out before their time because of inadequate inflation.

And inadequate inflation usually means an inadequate tube—one that holds air feebly, surrenders some, and inflicts insidious damage by failure to perform properly its part of the tire's work.

Whether you figure it in your tire bills, or in the mileage delivered to you upon the road, you cannot escape the fact that the tube's importance far outweighs its cost.

On this ground it is to your every interest that you put Goodyear Tubes inside your tires.

Putting them there means putting adequate and constant pressure there also—these tubes *hold* air. Putting them there means more miles to you.

They are thicker than ordinary tubes, and stronger—made up of many paper-thin sheets of rubber vulcanized together into a perfect air-retaining unit.

Their valve stems are vulcanized in also, not stuck on.

We especially recommend the Goodyear Heavy Tourist type for sustained and severe service. It is exceptionally stout and vigorous, a little higher-priced—and *better*.

The Goodyear Tire & Rubber Company, Akron, Ohio

printed on good paper and bound in cloth. The title, Bittner's Fifty Business Principles, was on the back, so that it could easily be read if stuck up on a shelf of books. It was printed in unusually large black type, with extra spacing and wide margins, so that it might be comfortably read on crowded street cars or by a poor light. It was not a thick book—it would slip easily into a man's coat pocket. The matter consisted of a direct talk purporting to be from Mr. Bittner to the reader. It was in his intimate personal style. The plan of study was outlined concisely at the close. From beginning to end there was not a stereotyped phrase, a usual expression or a trite claim. If we resorted to any of the ordinary plans by which business is built up, we so worded it that it sounded fresh and new.

In all this work, monotonous and tiring through much repetition, Miss Carrel was far more useful to me than Miss Douglass, though she could not take dictation. Miss Douglass had her one value—she was an accurate stenographer, and she satisfied herself with that. In fact, she rather resented being asked to do anything but take notes and copy corrected pages. But Miss Carrel would be at my desk the moment her work was finished, asking for more. She was interested in everything I did, and wanted to have a part in it. One day she found me laying out an advertisement.

"Can't I help you?" she asked, looking on with interest.

"Not very well. But you can take down that file marked advertisements and read our advertisements for the last year and learn our style. Then later you might be useful."

She took the file and went back to her desk to pore over advertisements until more copying was ready for her.

We tried out our advertisements before they were run. We had them set up and pasted here and there in the advertising sections of magazines, then we would lay them aside until the following day, when we would open the pages to see which style started up most strikingly to meet the eye. We tried them on Miss Krog, Miss Carrel, Miss Lutkins and William, and in this way they got the threshing out that a new campaign generally gets at a cost of thousands of dollars.

The Spring Campaign

We opened the campaign in the March publications. Mr. Bittner had timed this so that we would have three issues in which to test the plan immediately preceding the dull summer months, when business always fell off. This would give us time for any revisions and changes suggested by the practical try-out. For nothing ever works out in every detail as planned.

Some people, particularly women, regard business as a dull subject. I wish a few of these might have spent the month of March with us. When a woman spends two weeks planning a party she is usually on the *qui vive* till it is over. Mr. Bittner had spent two years, and I some seven months, planning a gigantic party for American business men. We had invested over a thousand dollars in the feast and thirty thousand in the invitations, and now the weighty question was—how many would accept?

The first morning after the March publications were on the news-stands I entered the office trembling with excitement and expectation. Bittner was there ahead of me, and he had the publications, all open at our advertisement, spread out on the long reading table. He was pacing the floor with bent head and hands behind his back, every few minutes stopping to look at the magazines. I paused by the table and examined each advertisement carefully. It was dignified, attractive copy!

"Sour on 'em?" he asked, halting beside me.

"No," I said with decision. "I still like them, and it's a wonder I don't hate them, I've worked on them so long. But they still give me a little shiver of pleasure. I believe they are good."

"If they're the right bait we'll soon know it."

I started to ask if Miss Krog had seen them, and then I closed my lips on the words. She was at her desk just within the operating room, and the expression of her elaborately arranged coiffure was ominous. I knew that she had ignored the advertisements. We had kept her in ignorance of the scheme, and she did not intend to show any interest now that the idea was made public. I was sorry about it, but there was nothing I could do. Mr. Bittner had every confidence in Miss Krog's loyalty, but he did not consider it good policy to tell his plans to anyone.

I went to my own desk and found a surprise. Mr. Bittner had put the entire stack of mail there for me to open. Of course he might have shifted the mail opening to me merely because I now had very little to do, since all the work pertaining to the Fifty Principles was finished; but I believed it was his sensitiveness—which he would not have admitted for the world—about opening letters that would begin to tell the story of our success or failure.

I began to open letters, and instantly Bittner took up his hat and coat and went out. All that day I opened the mail as it came in each delivery, separated checks from business-book orders and handed the one to the bookkeeper and the other to Miss Krog. Mr. Bittner did not return till closing time.

The following day I began to open mail, keenly expectant, for it was possible that a few inquiries might arrive from the city or near-by towns. All day I sorted letters and listed checks and orders. There was just one Fifty Principles inquiry. A man named Clarke wanted to buy the course outright. He wrote in a very kind, courteous manner, saying that though he appreciated the fact that he would miss a great deal in not subscribing in the regular way, he was too busy at present to do so. He inclosed a money order for fifty dollars. Bittner again spent the day at his club or elsewhere, coming in late in the afternoon.

A Competitor's Work

"It's early yet," I said, handing him the one order.

"It's darned queer," he growled, dropping into his chair and fixing his eyes on the letter. Instantly his head shot forward and his eyes burned their way through the request for the Fifty Principles. He got to his feet in a flash and brought the letter and money order over to me.

"Send it back!" he commanded, with a swift indrawing of his breath that had told me before of white-hot anger inside. "Tell 'im we don't sell outright."

"But, Mr. Bittner, it's really all in the 'talks'; and for a very busy man ——"

"Can't you see he's a tool?" he shouted, shaking the paper in my face. "This is Borrige & Kemp's first move. Can't you recognize fake politeness?"

He went back to his desk and I took another look at the inquiry. Yes, it was rather over-felicitous. I sighed heavily. Then it was all true, Bittner's cause for uneasiness over these persistent rivals.

The third day I was at the office at the earliest possible moment, and eagerly started opening the mail. There was not an inquiry. Bittner did not show up till noon, and then he came in as peevish as a teething child. He snarled at the girls for dropping crumbs, ordered William to clean up, and then went to his desk without speaking to me.

The fourth day there was an inquiry from a man named Wagner, who was connected with a small business college near Chicago. It looked promising, but someway just one inquiry seemed worse than none. It was almost an insult. I attended to it personally and said nothing to Mr. Bittner about it. The fifth and sixth days were repetitions of the first three—there were no inquiries. On the seventh day one letter carried the Fifty Principles key number, and I seized upon it eagerly and tore open the envelope. It was from the one inquirer, Wagner. He wished to subscribe, and accompanied his request with a money order for the full price. When Mr. Bittner came in I showed it to him and tried to laugh about it. "If every inquirer means a subscriber," I said gayly, "we're all right."

Again his eyes flamed with sudden anger and his breath came scorchingly; but he only said:

"Well, start him in!"

One subscriber, when we had figured on a thousand at the start! It was enough to enrage him.

The thing continued throughout March; there was not another inquiry for the Fifty Principles. Day after day Bittner became more silent and morose, and he was more and more absent from his desk.

Early in April I stopped by Bittner's desk and asked him what he thought of changing the style of the advertisements for May. It was too late then to do anything about the April copy. He looked up

Only a few days more will this 5-passenger 6-30 Chalmers remain at $1090. On March 1 the price becomes $1250. Prompt action now pays you $160. The roadster price also advances from $1070 to $1250, showing a saving of $180. Either model will prove the most sensible car you ever drove. Sensible because it is neither over nor under weight. Neither a speed car nor a slow poke. Instead: a simple, economical, soundly made car that holds the road, drives straight as an arrow, takes a hill with plenty of reserve, looks the good stuff it is made of, and acts like a thoroughbred. And the saving pays you more than 6 per cent on $2500.

(Concluded from Page 54)

and I saw that his face was haggard. His eyes were drawn back into his head, and the flesh had melted away from his chin, leaving it sharp and angular. I was shocked.

"Change it! What for?" he snapped. I was sorry I had spoken.

"Some other style might arouse interest," I suggested lamely.

"Didn't we study out those advertisements and decide that they were the right style for the men we want?" he demanded. "Didn't we agree to spend thirty thousand dollars on a three months' try-out?"

I had to admit that this was so.

"Well, then, what's eatin' you!" He sank back into his chair and I went on to my desk.

Daily the strain grew more tense. I was personally interested, but I felt Mr. Bittner's strain more than I did my own. All the years I had known him—and doubtless many more—he had been using his brain-power at full capacity. He had never taken a real vacation. The climax of his achievement was the Fifty Principles. He had put himself into this work like a fiend, never resting, never laying the subject aside.

How often I have heard men say, speaking of some venture in which they failed: "It was a bad year"; or "I got the wrong men in with me"; or "The thing was misrepresented"; always giving what seemed to them an adequate reason outside of themselves for their failure. But there was none of this in Bittner. When he failed he blamed no one but himself. Hard as he was on others, uncompromising in what he expected of them, he was no less hard, no less uncompromising with himself. The evident failure of the Fifty Principles was, therefore, a failure in himself, and it was gripping him vitally.

A Laconic Message

I went to sleep each night with a terrible stack of letters photographed on my mind. I dreamed of millions of letters that I had to open one by one, in an ever fruitless search for a Fifty Principles inquiry. I arrived at my desk each day, dreading a continuation of the strain. I told myself that when the three months were up and the thing was a proved failure Bittner would rally and put his dynamic brain to the task of reorganizing business. But the waiting was terrific.

Miss Carrel and I had just read proof on the May advertisements. Bittner had not been at the office for three days and Miss Krog had hardly spoken to me in that time. Miss Lutkins was more savage than usual and more absorbed. There seemed nothing human about the place, except Miss Carrel's ever eager face and poor little Blanch Booth's unhappy one—she was having a hard time getting used to Miss Lutkins. I think the child had never been harshly spoken to before in her life. I felt a wild desire to kill the May copy, write my resignation, place it on Bittner's desk and escape. I was tired of the strain and uncertainty and of the unsympathetic office atmosphere. I told myself I had earned the right to enjoy. I thought of my sixty thousand dollars tied up in a Western ranch. It could give me freedom and friends—and it should. I was a fool to remain longer in a place where the women were jealous or suspicious, and the one man always absent, leaving me to bear the brunt of things. I wouldn't wait a day longer. I seized my pen and began to write my resignation, when I saw William leading in a messenger boy.

"That's her," he said, pointing to me. Then he turned back to his parcel-wrapping. The boy came over to my desk and I experienced a sudden sinking sensation. He handed me a note. With trembling fingers I tore it open and read in an almost illegible scrawl:

"Come at once with the boy. Say nothing.
"BITTNER."

I closed my desk, and putting on my hat followed the boy out. Bittner was in some kind of serious trouble, or he would never have sent for me like that. When we reached the street I turned to my companion.

"Where are we going?" I demanded sharply.

"To the St. Mark's Hospital. Guess it's a deat' or somepin."

The Man at the Top

By WILLIAM H. HAMBY

THE station agent at Hicks Mills used to impress me much as I imagined King George did a Colonial who approached him with a petition under his arm.

Hicks Mills had twenty-two houses and the depot. There were two irregular trains a day, besides an occasional freight; so the agent could not have been habitually exhausted by overwork. Yet it was very difficult to transact business with him, even on a cash basis. And as for getting free information on such irrelevant subjects as whether you had any freight stored in the station, or the probable hour of arrival of Number Three—why, that was a hazardous undertaking.

As a youth I have often stood at the ticket window with my money in my hand and my heart in my mouth for long stretches of time, watching the brown birthmark on the left side of that operator's neck, while he sat in the chair on his fourteenth and fifteenth vertebræ, his back indifferently turned to a boresome world. When he finally did, with great reluctance, twist himself from the chair and approach the window, he always stood looking languidly at the ticket stamp on the right of the window, as though under no circumstance would he demean himself by looking at me; and on his lips was that insolent curl which you see on a lawyer's when he asks the witness whether he has ever been in jail.

If I ever got up enough courage to ask him a question he ignored it—as any gentleman should an insult; if I repeated the question he showed symptoms of violence.

One summer my father gave me the peaches on two of the best trees in the orchard. There were about ten bushels and I conceived the idea of shipping them to a small city fifty miles up the road. We had never shipped any fruit; neither had our neighbors; and I did not know how to go about it. The only thing to do was to go to Hicks Mills and inquire of the railroad agent.

For minutes I stood at the window, waiting as usual for Brown Ellis to turn his face to the public. Finally I made a timid noise on the window ledge with my pocketknife and he looked wearily over his left shoulder.

"I want to ship some peaches," I gulped.

"Well, ship 'em!" said Brown.

"How'll I fix them?" I asked anxiously.

He stared at me blightingly a full minute.

"How in hell do I know? Do I look like a hayseed?"

Another Kind of Railroad Man

A few months ago I stopped in front of a fruit store, looking at a box of extra-fine peaches. A keen, busy, forceful man stopped beside me.

"Ozark peaches," he remarked.

"I wonder," I asked, "how many cars the Koshkonong District will ship this month?"

He told me—and told me more. He explained in a few minutes the preparation the railroad was making for the handling of the fruit. He described the new coöperative organization of the growers for gathering, shipping and marketing peaches. As I manifested an interest in the matter he held out his hand and remarked:

"I'm the general manager of that railroad system. The next time you are in Springfield come to my office and I will give you all the data you want."

Two weeks later, while in that city, I remarked to a friend who was showing me the town:

"Stop at the Railroad Building. I want to go up and see the general manager."

"General manager!" He looked as though he thought it was a hoax; but when he saw I meant it he remarked dubiously: "I suppose you know that his time is worth about five hundred dollars an hour."

"Oh, well," I said, "I am not paying for it."

I was sent in to the general manager almost immediately, and we talked for an hour about railroads and peaches and poetry; for he would not let me go until he had read two or three recent poems that had caught his fancy. And even then he got up and went out down the street, bareheaded, to the railroad tracks, a hundred

ACORN RANGES

MUFFINS!

Who likes brown muffins?

Who likes to make brown muffins?

Who likes the girl who likes to make brown muffins?

Back of all the really good things in a life that's worth the telling, must be those who sense the artistry of doing each thing well. It's the *genuine pride of doing*, not the snobbish pride of show, that makes the happy housewife make the muffins brown just so!

Recipe for muffins: A cook with lots of pride; flour, butter, etc., any ordinary cook would use, but each ingredient made by people who like to do things well; put in the fine, hot oven of a *good* range made by people with a genuine pride of doing.

We want the younger ladies of America to know Acorn Ranges as so many of their elders know them. We have made Acorn Ranges for 87 years, and are proud of having made them better and better as the years have gone by.

ACORN RANGES

Gas, Coal, Combinations and Electric

Always Improving

The chief purpose of a kitchen: A Good Place for a Good Range

Baby Grand

Go to your dealer's or the Gas Company display rooms and see the Acorn Baby Grand—two baking ovens, one broiler oven, warming oven, six top burners—very compact.

If gas is available, but you have to use coal part of the time, the Acorn Combination Range for both coal and gas certainly will save you space, time and fuel. In another model a lever does it all. Lever up, gas stove; lever down, coal stove. No heavy oven bottom to remove.

Combination

If gas is not available, let your hardware or furniture dealer show you an Acorn Coal Range designed to cut down coal bills and save many a step with a heavy coal-hod. Special designs for each kind of coal.

The Acorn Electric Range, a joy and pride to the housewife who is so situated that electricity is the fuel she ought to use. So thoroughly attractive it would not be inappropriate in the dining-room itself. The charm of the chafing dish and the utility of a range combined.

RATHBONE, SARD & COMPANY

yards below, to show me the operation of a new switching device.

"Hello, George! How does she work?" the general manager said to the fellow in charge.

"Fine!" replied the switchman enthusiastically.

"By the way," I asked as we stood discussing switches and accidents, "how long have you been in the railroad business?"

"Seventeen years—and all that time with this road."

"You must have begun about the same time that Brown Ellis became agent at Hicks Mills."

"Yes; I knew Ellis," he replied. "He was still the operator at Hicks Mills when I became chief dispatcher of that division; but we had to fire him."

"What is he doing now?" I inquired.

"The last I heard of him," answered the general manager, "he was janitor in a livery stable."

If you want to get to the bottom of a thing go to the man at the top. He not only knows it but is willing to tell it.

There are several ways to try to magnify one's job, but only one way to do it. There are thousands of little men like Brown Ellis at Hicks Mills, who, given a small position, puff up with insolence and try to make themselves seem big by making other people feel little.

There are whole shoals of clerks and doorkeepers and flunkies who, when vested with a little authority, imagine they are increasing their importance when they overwork that authority.

But all these fail; practically none of them go forward—and most of them drop out entirely. There is only one way to increase the importance of any job, and that is by increasing its usefulness.

The post of agent at a cinder station—a job that pays sixty dollars a month—does not impress one as important, no matter how boredly superior the operator may appear. But I know a ticket agent at a small station who can, without looking at a time-table, plan your trip over any road to almost any spot in America; tell you the best connection, the most interesting scenery, the most comfortable hotels, at just what hour you will arrive in any given town and at what minute you will get a train out; where you are allowed to stop over and exactly how to do it. He may make mistakes, but I have never discovered one. He stands at the window or the telephone and lays the transportation system of the country at your service.

Now that man's job seems important to me. He is doing a difficult thing, and doing it well; and it is a thing worth doing. He is magnifying his job, and one day he will be given a job that is already magnified. Of course that man is courteous and approachable, and invariably gives information or renders assistance to travelers as though it was a pleasure to him—as it really is.

Surliness is either an effort to make others suffer for one's own bad digestion or blunders, or else it is assumed from a foolish notion that it gives an air of decisiveness and importance.

Two Kinds of Answers

We all dislike effusiveness and have come to look upon it as the tintinnabulations of a thin mind. Palaver—a spatter of inane irrelevant remarks used solely in a selfish effort to cultivate one—is always nauseating. And in their proneness to go to extremes many essentially friendly people go to the opposite extreme and cultivate an unnecessary brusqueness.

Real friendliness consists in rendering efficient service pleasantly. No matter in what capacity a man works, or how busily, it is up to him to do what his job requires—and a little more—and be pleasant about it. That does not mean smiling necessarily—some really happy people cannot smile. It does not mean that one must be chatty and discuss the weather as he makes change; but it does mean that he should render the service with an air and an accent of willingness, so that the receiver shall not feel that he is an interloper and his business an imposition.

If you had asked the agent at Hicks Mills "Is there a westbound train at four o'clock?" he would have answered "Naw!" If, when the present general manager was agent at Sarvis Point, you had asked him the same question, he would have replied: "No; but there is one at five-fifteen."

See the difference? One word more, a rising or falling inflection, a look direct into the face, a gesture of the hand, may make the difference between a grouchy, disagreeable service and a willing, efficient one.

The man at the top is usually the friendliest man on the job.

One morning last winter in New York I spoke to a friend about getting a check cashed.

"Why," he said, astonished, "you don't expect to cash an out-of-town check in New York? And you a stranger!"

"I never have been in a city where I could not cash a check if I needed to badly enough."

"You can't do it in New York," he asseverated. "It is impossible! It simply isn't done."

I laid a wager with him and returned that night with the currency.

"How did you work it?" he demanded curiously.

A Bet Easily Won

"I did not take it to the paying teller," I replied. "The paying teller of a New York bank would not cash a Government check unless the Secretary of the Treasury was present, with the whole Cabinet to identify him. I went to one of the big banks and, having learned the name of the president, walked straight back and asked for him by name—not by position. I introduced myself to him, shook hands, and told him I was from the West. After we had chatted ten minutes, discussing Western crops, commerce and banking interests, I mentioned that I had a check I wished to cash. He O. K.'d it without a moment's hesitance, shook hands at parting, and told me to be sure to drop in whenever I was in town."

The man at the top is the least suspicious man in the institution. Suspicion is the cloud in the mind of a man who does not know. The smaller a man's horizon, the more often will it be clouded with suspicion. The gatekeeper regards every man who speaks to him as a deadhead. He would suspect the owner of half a continent of trying to work him for a pass as quickly as he would a paste-diamond four-flusher. But the man at the top does not need to be suspicious, for he knows the difference.

In dealing with those exalted personages who stand in outer offices with icy swords, to guard the head of the institution from interruption, I learned quite by accident never to ask for "the president," "the manager," or "the secretary."

I was in a strange city and wanted to go through a big sugar refinery. All the way along the line I was told "No," most emphatically. But I persisted until I got to the office and asked whether the manager was in. The clerk looked at me dubiously and shook his head. Now I was sure the manager was in. But when his chief clerk assures you that he is not, there is nothing to be done about it unless you are overly athletic. I went back to town dampened, but not discouraged.

When a fellow has started in he hates to be kept out. In town I inquired whether there was any pressure that might be brought to bear which would squeeze me in. And incidentally someone mentioned the name of the manager—Mr. Harter.

I went back to the plant that afternoon and walked straight through the gate and across the grounds, as though all the orders of the Allies for sugar rested in my inside vest pocket. I approached the clerk in the manager's office authoritatively and asked briskly: "Is Mr. Harter back from lunch?" I went in to the manager at once; and, as he discovered that a friend of mine had befriended his son somewhere in Cuba, he made an exception to the rule and sent me through the plant.

Since then, when I have business with the head of an institution—and I never go unless I have business, preferably mental business, for they love to discuss problems—I invariably ask for Mr. Calder, or Mr. Barton, or whoever happens to be in an official position at that time.

The man at the top is direct and likes directness. He gives extra consideration to the man who, really meaning business, comes straight to him with it.

It was a small city and I was overlooking no chance for information on a subject in which I was interested. Some random individual downtown told me that the

At Last! A Nation's Need is Supplied-

DISCARD your old fashioned overalls, men! Slip on a suit of **Lee Union-Alls!** You'll never wear anything else to work in. Such an improvement! Such convenience! Such service! It's the work garment men in all walks of life have been waiting for. The mechanic, the motorist, the farmer, the laborer, the man who does odd jobs about the home and works in his garden—to every one of these, **Lee Union-Alls** are a revelation of comfort, convenience and serviceability. You'll forget there was ever such a word as "overall." Work clothing will mean **Union-Alls** to you first, last and all the time. Cost no more, either, than old fashioned, inconvenient, binding two-piece garments.

Lee Union-Alls are all in one piece (like your union underwear), which means there is no belt to bind, no double thickness at the waist, no jacket tails to get in the way. The suit slips on easily and quickly and can be worn conveniently and comfortably over clothing or next to your underwear. It is already the fastest selling work garment ever manufactured. You'll know why the minute you put on a suit.

Lee Union-Alls are made to endure the hardest wear—every strain point reinforced—all seams triple stitched; every button hole machine stitched; eight convenient pockets. **Lee Union-Alls** are made of Khaki, blue denim, express stripe, pin check or white drill.

Lee Union-Alls for children are made "just like Dad's," a complete one-piece suit, that pays its cost many times in the saving of clothing, washing bills, stockings, etc.

Lee Union-Alls are at first class dealers' everywhere. If your dealer cannot supply you, send your order direct to any of our factories, enclosing post office money order and stating size and material desired. Sent prepaid to any address in the U. S. Take no substitute. There is none "just as good."

MEN'S: 34 to 50 chest, $3.00
YOUTHS': 12 to 17 years, $2.25
BOYS': 7 to 11 years $1.75
CHILD'S: 2 to 6 years, $1.50

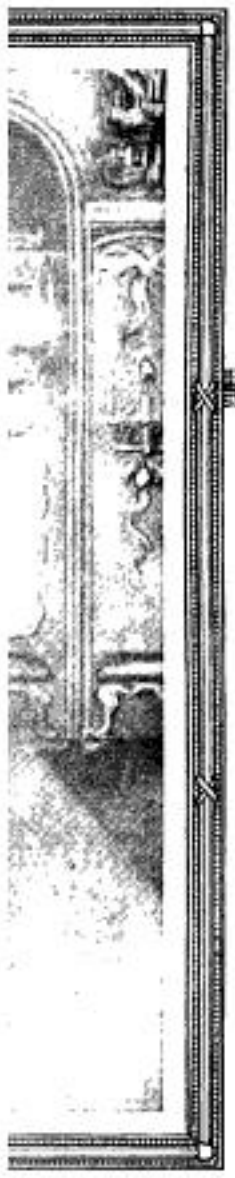
and broader. Miss Case sang the well known aria from Charpentier's "Louise." "A Song of India" by Rimsky-Korsakow, and a number of folk songs.

Arthur Walsh, violinist, played Schubert's "Ave Maria" with the diamond disc and also the famous "Meditation" from "Thaïs," by Massenet. He also accompanied Miss Case, voice, violin and the "recreator" blending into one beautiful tone.



Silverstone has given these tone tests for several years and with each performance hundreds of the skeptical listeners go away convinced that the new Edison does re-create and that one can now have the greatest artists in their home. Records played by an instrument that does not betray itself in the presence of the artists.

Daily Globe-Democrat.

2500 HEAR NATURAL VOICE TONES IN PHONOGRAPH

That Thomas A. Edison has successfully accomplished the marvelous task of re-creating the natural tone and timbre of the human voice in the production of phonographic records was the verdict last night of 2500 music lovers who gathered at the Victoria Theater to witness this demonstration of the triumph of inventive genius. Of the numerous persons who attended the demonstration skeptical of the claims made for the records, all came away convinced that it had proved equal to the severe test.

Miss Anna Case, the young prima donna of the Metropolitan Opera Company, was chosen for the test. Edison considers her soprano voice one of the finest of the many great voices he now re-creates. She stood beside the new Edison as it began to play. She sang a few bars, and the instrument blended perfectly with her silvery voice. She ceased, and the instrument continued the air with the same beautiful tonal quality as when the star accompanied it. None in the audience was able to distinguish when Miss Case ceased singing, except by observing that her lips did not move. The unison between the tones of her voice and the reproduction on the instrument was so remarkable that trained ears could not detect the slightest difference.

There is a licensed dealer in your vicinity. Watch for his announcement May we send you the brochure "MUSIC'S RE-CREATION"?

impression among some men way they can protect them- erruption is by exclusiveness. . A man cannot hide from not burrow deep enough, or closed doors thick enough, of stony-faced sentinels close cape from that long-winded o wishes to prove to him that the first man who ever ate dy Hook.
elected governor of a Middle ien he went to the Executive d his office arranged in the r: first, an office boy; next, r; third, an assistant secre- he governor's secretary; and luded, almost padded remote- of the executive himself. This governor said to the office boy: "Jim, you have my seat; you go back to the far end." And, calling his secretary to the next post, he reversed the whole order. He was not only the most popular governor the state ever had but transacted more business.

The man with a quick mind and a simple, straightforward approach can discover a caller's business and have it transacted before the ordinary office force could get a card to him. Certainly not every man could follow the governor's example. There are times and affairs which require absolute privacy, and that privacy must be protected; but, other things being equal, the bigger a man the less protection he needs, and the harder a man is to approach the less worth seeing he is.

The peasants of every country have a story of how their favorite king once appeared before some lowly door, disguised as a shepherd or hunter, and, seeing the bread about to burn or a board needing nails, did a simple homely act. All the king's greatness as a warrior and all his glory as a courtier have become their own because the king for that moment became one of them.

Often one hears the same story on a railroad—how the president of the whole system stopped and helped a section man push a hand car. Or the humblest voter will thrill as he recites how a man stepped off at the Junction and chatted with him—"Just as plain as shucks!" And he afterward discovered that he was a cabinet member, or a famous senator, or the President.

Now it is not condescension in a real king, or in a great man of any sort, to do a homely thing or to meet in a simple way his plainest fellow being. A great man never condescends. He does not need to, for he is already on a level with all his fellow men.

The Simplicity of Greatness

Greatness is not in elevation, but in perception. The top of the mountain and the highest rung of the ladder are very good figures of speech; but great men—successful men of every sort—do not live up there. They stay on a common footing with the great mass of mankind. They have a common bond with them—only they see and feel more. They feel and understand as other men do—but more penetratingly, more clearly. They know the value of ordinary things in a way ordinary men do not.

And it is this simplicity, this open-minded interest in everything from the bottom up, which has furnished the inspiration for their success. They have been able to see and use all sorts of material; and, understanding men, have been able to organize and use them too.

Of course there are exceptions—seemingly; very proud, haughty, overbearing men at the heads of great institutions and enterprises. There are a few of that sort—a very few. And most of them have become soured self-worshipers since arriving—not before; else they would not have arrived.

It is noteworthy that the great men we have loved—statesmen, artists, scientists, writers—have had, for the most part, almost a child's simplicity and modesty. They know their worth—some of them were even egotistic in one way or another; but in their spirits they were very modest and very accessible.

Getting to the top is a hard, painful job. Getting anywhere is. A man needs every help he can get. He needs, above all, the active sympathetic interest of those round him. He needs a clear vision to help him miss some of the false steps. He needs an abundance of warm enthusiasm and a lasting appreciation of things that count.

All these make it necessary for him to have a sort of universal understanding and sympathy, which will give him directness and simplicity. He is never fenced in by tortuous manners; nor is his view obscured by circumlocution of phrases. He meets men and ideas and circumstances face to face—smiles if they are friendly and sets his jaw if they are not. But, whether friend or foe, he makes no assumption of arrogant superiority. It is merely a matter of man to man.

His work, his environment, his health, may modify the customs and habits of the man at the top; but eight times out of ten at heart he is the simplest, friendliest, most approachable, most open-minded, most direct man in the whole concern.

For this is the manner of man who gets to the top.

Smart Serge SUIT $15
Made to your measure
Pure Silk Lined

We sell direct by mail. We have no agents.

Style Book and 72 Samples FREE

All Wool Serge Suit, Silk-Lined, $15
Made-to-Measure —By Mail
Colors: Black or Blue.
Lined with Skinner's Pure Dye Silk.
Sewed throughout with silk.
Hand-made button holes.
Coat front re-enforced with real hair cloth and canvas.
Hand-tailored throughout.
Made in any style you want.
Guaranteed to fit perfectly or your money refunded.

AS an introductory demonstration of our value-giving, the Bell Tailors of New York, for $15, will make you a smart serge suit of American Woolen Company's ✻6055 pure, all-wool worsted serge;—guaranteed fast color.

We will line it with Skinner's guaranteed pure dye silk. In fact, we will use the best standard materials in every step of its making. We will guarantee it to be a perfect-fitting, splendidly-tailored, smartly-styled suit that will compare favorably with any you have ever had for even a third more price than we ask.

This is but one of the Seventy-two exceptional values we offer in our catalog of smart, New York made-to-measure clothes.

Send for New Style Book and 72 Samples—FREE

BELL Tailors of New York are the largest direct mail order tailoring concern in the world—37 years making clothes for smart dressers of America.

Our only salesman is our catalog, which we send with samples and complete outfit with which you can take your own measure. We have no agents or out-of-town representatives of any kind. We deal direct with the consumer by mail, eliminating all in between costs and expenses, and giving you the benefit of the money we save by having you wait on yourself.

Money-Back Guarantee

We guarantee to fit you perfectly from the measurements you send us and to satisfy you in every respect. You are the sole judge, and if you are not entirely satisfied with the clothes we make you, we will cheerfully refund every cent of your money.

Let us send you our new Style Book and 72 cloth samples. It places you under no obligation to buy, but it will show you how to get the smartest New York, made-to-measure clothes at a worth-while saving. Write to-night.

UNCLE SAM IN FAIRVIEW

(Continued from Page 15)

strain of chickens, introduced by Mrs. Wilberforce Fogg. They figure on making the two-hundred-egg hen a back number by developing whole flocks of two-hundred-and-fifty-egg hens, thereby adding to the national wealth a figure one and a whole hatful of noughts. We find these things very fascinating, and lots better things to gossip about than others that might be mentioned.

All this showed me the value of the county agent. Our neighborhood was all right as a neighborhood; but it was not large enough for the coöperation and the organization we needed. For instance, when the Federal Farm-Loan Act was passed it was not in the Fairview Settlement that the first National Farm-Loan Association was formed for the purpose of getting the benefit on the farm of the building-and-loan association idea, which has done so much in the cities, but over on Beaver Creek—quite out of our bailiwick.

Freeman Clay found out that several farmers over there needed loans on long time for slow-fruiting improvements; and though he didn't appear in their organization he did figure out for them that by borrowing money for thirty-six years, with the privilege of paying off in whole or in part after five years, they could earn more than twice the interest charge and not be worried about the mortgage ever falling due. They have the right to call their own loans at any time after five years, and nobody else on earth has that power over them. In other words, for the first time in the history of the American farmer the borrower rather than the lender is to have the say about time and terms.

The Beaver Creek people are admitting a Fairview borrower to their association occasionally. The Reverend Frank Wiggins was the first of us to go in, so as to get the money to finance a silo and a lounging barn for his cows—he is abandoning the stanchion system, though I think he is wrong in that.

The money obtained through the government system costs five per cent. One per cent more—making six per cent a year—will amortize, or "kill off," the mortgage in thirty-six years. Frank figures that even on a fifteen-acre farm he can easily make the silo pay him ten per cent on the investment by keeping the silage made in seasons of excessive crops for bad seasons when feed is scarce through drought or something of the sort.

"There is never a time," says he, "three years together, when a silo will not pay for itself in whole or in great part by giving the dairyman feed when otherwise he would have to buy dear or sacrifice a part of his herd. It doesn't pay, perhaps, to fill a silo in September and begin emptying it in October; but give me silage in August every year when the pastures are short, or the silage of wet 1912 kept over for dry 1914, and I'll show you profits on the silo that will make both interest and amortization look small."

Cheap Working Capital

This is pretty sensible talk for a preacher; and I was gratified to see Frank developing sound business sense along with his visionary ideas. I discovered, however, that he probably got it from the county agent, Freeman Clay, who was preaching all over the county the fact that the new Federal Farm-Loan Act is making it necessary for the farmers to figure interest on investments instead of first costs.

"Don't ask me what this will cost," he used to say to the farmers we visited, "when you can get the money on your own time at low rates of interest whenever you want it. Ask yourself what interest it will pay on the investment. If it costs you two hundred and fifty dollars a year, and pays you four hundred dollars, you can add one hundred and fifty dollars a year to your labor income by borrowing.

"Instead of a mortgage being a disgrace under such circumstances, it is a discredit not to have one."

He pointed out to me the fact that the small borrower now has an equal chance with the big one. Now it has been for a long time a fact in the Corn Belt that the farmer who doesn't need a loan of at least four or five thousand dollars isn't of much consequence to the loan companies; though for the big loans we certainly have already had good credit at rather low rates. Personally I never felt that it was good business to encumber my farm for two or three thousand dollars, and I never needed all my farm would stand in the way of a loan; but lots of men who could borrow ten thousand if they had to could use a quarter of that as working capital at a profit.

I began figuring on the thing; and Freeman and I worked the problem out in this way: I might take, say, twenty-five hundred dollars in a Federal farm loan and use it in developing my feeding operations.

I could, for instance, get the money cheaper in that way for buying lambs to put in my cornfields after harvest to clean up the pigeon grass that naturally comes in, and to eat the lower foliage of the corn and the rape I might sow between the rows, and make fifty cents or a dollar a head by the operation. It's good farming to do it too. Or I might take advantage of the market to buy any other stock—when it is cheap—as steers or heifers or sheep, as my feed made it possible. That much money ought to pay for itself, and a little besides, as I'm fixed.

"But," said I, "as I turned these deals the money would come in and would be idle at times, and all the while I'd be paying interest on it. That's an objection."

"You ought to figure to keep it busy," said he; "that's a part of the business of a business farmer. There ought to be a textbook published on the use of money under the Federal Farm-Loan Act. It's going to be the most important part of the farmer's business from now on. As for your periods of idle money, why not invest it when it must be idle in Federal Farm-Loan bonds, and cut down your loss of interest to one per cent or half of one per cent? You ought to be able to stand that for the sake of having a supply of working capital."

A Plea for the Small Farm

I am so much impressed with the idea that I believe I'll join the Beaver Creek National Farm-Loan Association, and indulge in the luxury of keeping two or three thousand extra dollars working for me all the time. That's how the new law will help the farmers with big investments in their farms. If I don't like the scheme I'll pay off after five years. I feel perfectly sure I can make money by the transaction; and I surely can't lose much.

This sort of business farming is coming to be a great part of the county agent's work in the Corn Belt. To be sure, he still looks after the A B C of farming—in cow-testing associations, boys' and girls' clubs, canning clubs, pig clubs, acre-yield contests, seed-corn campaigns, calf fairs, colt fairs, egg circles, beef rings, and county short courses for the young people; but in a community like Fairview, already well socialized by such people as our school force and the Wigginses, he has to rise to a higher plane. He reached this, too, in another movement he inaugurated. That was the contest of Extensive versus Intensive Farming.

Frank Wiggins is an enthusiastic exponent of the small farm.

"I tell you," said he to Freeman Clay and some more of us one day, "Doctor Spillman's investigators in the Department of Agriculture may show that, as farming is now done—here, in Chester County, Pennsylvania, and elsewhere—the big farm pays the better labor income; but what they say isn't the last word. My little fifteen-acre patch of glebeland is nearer the last word."

"You don't make the labor income off it," said Freeman Clay, "that Mr. Dunham and Mr. Bohn or any of the other big farmers make on their operations."

"True," said Frank; "but see who does their work and see who does mine. My work is done by a self-respecting citizen of the community, who has a happy wife doing good things in the community, and a couple of healthy babies. Who does Mr. Bohn's work or Mr. Sharpe's?"

"Hobos," said Jeff.

Abel Bohn nodded. So did I.

"You big farmers," said Frank, "make your labor incomes out of men who drift out in the farming season, and in the winter spend their time in lodging houses for down-and-outers in St. Louis and Chicago; and eke out the time before the spring elections by selling their votes in

Should You Be Permitted To Know The Size Of Your Shoes

WE were just saying in this page recently that your average shoe-store doesn't permit you to know the *origin* of your shoes.

It likes private labels — its own name stamped in the shoes.

Further than that, it doesn't think you are to be trusted with the correct *size* of your shoe.

You may think you know the size you have on. Look in the lining where the size-stamp is supposed to be, and unless you wear Regal Shoes, you will probably find something like this: 2X4V7Y2.

Why all these secret signs and symbols?

They belong to the Dark Ages of merchandising—before the days of fixed prices, uniform profits, and standard merchandise of known value.

One great source of dissatisfaction and foot trouble is that shoes are *not properly fitted.*

The shoe-dealer objects to plain size-marks that anybody can read. If he is out of your exact size he wants to substitute another size from his stock.

We plainly mark the size in Regal Shoes to prevent this very thing. We want every man or woman to find comfort in Regal Shoes. We particularly do not want a wrong size to go on anyone's foot.

Daylight methods—all the cards on the table, frankness, publicity—are here to stay.

People prefer to buy goods they *know all about.* The movement toward *standard merchandise* in all lines was never so pronounced as it is today. Poor merchandise doesn't seek publicity—it evades it.

To the man who has found a shoe he likes, in a last that fits him—if it is an honest shoe by a reputable maker: if he can always go back and get that shoe, find the style right, the quality uniform, the price fair—we say to that man, stick to what you have! We do not ask you to change!

Much as we would appreciate your trade and well as we might serve you, we do not grudge any good maker the custom he has won.

What we *do* say is that the number of such shoe-wearers is smaller than it has any business to be.

Shoe-quality—shoe-service in general is a variable quantity.

Beginning away back with the "take off" of the hide, there are things you can't *see* that affect the quality of your shoes.

There is too much tendency to keep you in the dark.

In nearly every community there is at least one alert shoe-dealer who is not in sympathy with this backward policy. He follows it because it is the practice in the trade.

There may be at this moment in your town a wide-awake shoe-man who could build up a great business on shoes of *known merit*—authentic styles, plainly-marked sizes, and *values* he does not have to excuse or explain.

Is there any reason why he could not make as great a success of Regal Shoes as is being made elsewhere?

Regal Shoes are a known factor. They are *proving themselves* every day with men and women in the great Metropolitan Fashion Centers, and in the hands of special Regal representatives in a thousand towns and cities throughout the country.

Cities and folks do not differ greatly as to what they like best in a shoe-store.

For one thing, they like to know that there is an *institution* back of their shoes.

With us it is just a question of finding, in each community, the right kind of shoe-man.

Perhaps you know who he is, in your town, right now!

Chi for beer and a warm place by the radiator. They are the Huns and Vandals who will tear down our Greater Rome. With my little labor income I live like a king; and I'm a good citizen. Yours is not clean money, my friends—mine is!"

There was a long pause, during which I waited for some one readier-witted than I am to show Frank the foolishness of this visionary stuff. Finally Freeman Clay spoke up.

"I have been thinking," said he, "that it might be instructive if we made a comparison of the results, even in labor income, between the small farm, well tilled, and the large farm. What the Department and the state stations have published, you know, shows only average results. Average results in Mexico or Argentina would damn the farm of a thousand acres as against the ranch of from twenty thousand to a million. The question is: What do both show in profits under the best conditions?"

"In profits?" said Frank. "And in men, women and children?"

"Yes," said Freeman Clay; "and in social values. Of course they come in, but not for the economist."

"So much the worse," said Frank, "for the economist. What is Uncle Abner's bank roll worth if it means a man or two every winter rotting in a Chicago saloon?"

"Suppose," said Freeman, "we run a contest, beginning March first, between a dozen small farms and a dozen large ones."

"I'm in!" said the preacher.

"And you'll be in," said I, "with fifteen acres of the richest land out of doors; because you flimflammed me out of a marsh and wheedled Abel, here, into letting you pump the water across the road on him! Do you call that fair?"

"I do!" exclaimed Frank. "I'm making billions of blades grow, Uncle Abner, where you and Brother Bohn, by your mulishness, made cat-tails and wild parsnips grow, and never would have done any better."

"That," said Abel, "is true, Brother Dunham."

Barto's Labor Income

Well, we had the contest. I went in; and so did Abel and Jeff Sharpe and Wilson Beebe and enough more farmers to make a dozen. Frank's farm was the baby of the small holders, and the others ran from forty acres up to eighty—all small farms for this part of the country. I never took so much pains with my farming since I broke the prairie in the seventies.

Freeman Clay, impartial as a judge, went from farm to farm, big and little alike, and talked things over with us. There was a good deal of excitement at our County Farm Bureau meetings, and a lot of mental money changed heads on the outcome. The state experts got interested. The results are embodied in the first bulletin published by our County Farm Bureau, written by Freeman Clay.

Jeff Sharpe's income was, by all odds, the largest; but I was beaten by Peter Barto, with his little dinky forty-eight-acre farm and his ten-cow dairy. We eliminated truck farms and orchards, because we wanted the race to be run by real farmers mounted on real farms, and there is no doubt that Pete's is such a one. Here's his record for the year, giving him more than two hundred dollars more than I made on my operations:

Income	
Milk checks	$1500
Hogs	300
Fruit	100
Poultry and poultry products	100
Calves sold for veal	65
Seed grain sold	150
Stock sold	450

Income	$2705
Total expenses	1402
Labor income	$1303

CASSCO
ENGINE DRIVEN
TIRE PUMP

This engine-driven tire pump will save your energy and your time and will save you $30 or $40 a year on your tire bill.

It saves time because it inflates your tires faster than any other pump—*in one-tenth the time of hand-pumping.*

It saves energy because you won't have to do back-breaking work with a hand-pump. Pumping by hand is a dirty, disagreeable job that ruins your clothes and your temper.

It saves money on your tires because it keeps them properly inflated all the time. *Under-inflation causes 80% of all tire trouble.* Keep your tires pumped to standard pressure and you will double your tire mileage.

99.2% factory built—not assembled

The Cassco Pump is *not assembled;* it is actually *built.* 99.2% of the pump is manufactured in the West Side Foundry Co. shops at Troy, N. Y. Only hose, gauge and two small stampings are purchased. We save more than 25% because we do not have to pay profits on various parts to several manufacturers. You get the benefit of these savings.

Designed by expert engineers

The Cassco Pump was designed by expert mechanical engineers. It is simple and scientific in design. It takes up little space. It is easy to install. A motorist can attach it himself. Once in place, it is always ready for service. With one easy motion of your hand you can mesh or unmesh the gears. It requires no attention except occasional oiling. Its few, strongly made parts are never out of order.

Dry air—no oil spray

The air from the Cassco Pump is dry and clean. The Cassco design of piston and cylinder prevents oil spray. Oil ruins tires. The Cassco Pump will inflate a 34 x 4 tire to 80 pounds pressure in 1½ minutes. Smaller tires take proportionately less time. The Cassco Pump has given satisfaction to every user.

Save your time, energy and tires—put a Cassco Pump on *your* car today. Your dealer will supply you.

Digitized by Google

Now this makes Peter Barto easily the real winner of the contest, though other large farms besides the Sharpe place brought in more labor income than did Pete's. Pete had a good income when it is considered that all the produce the family consumed for their living is left out of the account; and when it is further taken into the reckoning that the average labor income of the American farmer is from two hundred to four hundred dollars after allowing him interest on his investment at five per cent instead of six, as was done in our contest.

You see, Pete's folks had $1783 to spend that year when their interest on investment was added to their labor income—and they had this after they had got a good part of their living off the little farm. Note, too, that Pete's folks did practically all their own work; but don't think that the Bartos lived below American standards. They have running water in the house, a fine bathroom, furnace heating and a gasoline lighting system; and Pete's car cost more than mine. They use it, too, in a sensible way; and as liberally as people can who do their own work.

They have a milking machine for their cows, and every up-to-date thing that ought to distinguish well-to-do American farming. Their farming is not fancy, but staple farming. The basis of it is ten cows; not pure-breds, but grades, that bring in from $102.30 a year—the record that year of the poorest—to $208.23 a year, which was earned by his best, a prize-winning milker.

Barto was not, like Frank Wiggins, blessed with a farm of exceptional richness. It was badly run down when he bought it, fifteen years or so ago. He labored under a mortgage, too, for years, and paid it off from his earnings. He made his original start on a small farm and his whole proposition is a small-farm success. On the farm he keeps the ten cows, a team of horses and some young stock, besides the poultry and the automobile. His success has been made with cows, tile drains, clover and barnyard manure.

This demonstration was made by Freeman Clay, I feel sure, for the purpose of showing the Department of Agriculture that there is something yet to be said as between extensive farming and intensive farming.

Frank Wiggins, whose record was pretty good, was exultant. He preached a sermon the next Sunday on the text "I went by the field of the slothful, and by the vineyard of the man void of understanding," in which he showed, to his own satisfaction at least, that Freeman Clay is tilling his own particular field—to wit, this county—mighty well; and that the fellows who speak for the big farm, just because the big farm pays best as it is farmed on the average, are the men void of understanding.

Farm Missionaries

Not that I think this is just. I believe that one of these days the Department will come out with a study of the small farm which will tell us something about what they call successful departures from the norm toward more intensive farming; in fact, a few years ago they did this very thing, but have since discredited the Bulletins on Small Farms with matter that seems opposed to their lessons.

Not that I have become a believer in intensive farming of the sort preached by the Little Landers—who, it seems to me, are just plain crazy; but there is a middle ground between the pocket-handkerchief farming of Japan and the all-outdoors kind which the experts now seem to favor. The big farm is morally wrong, so long as there are people who want farms and can't get them.

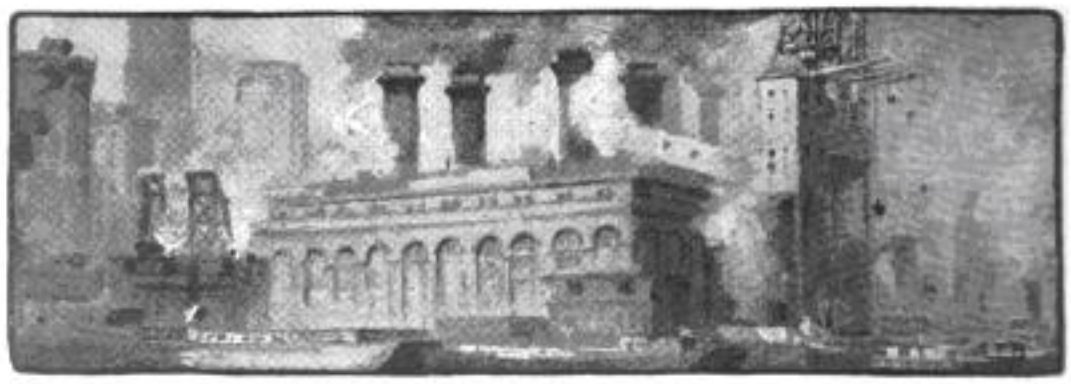
I think I must have made plain by this time the function of Uncle Sam in Fairview. It is to show us that, no matter how well organized a neighborhood may be, the county agent is needed. Uncle Sam, through the county agent, possesses the power to spread the good things of our Fairviews over whole counties, states, and finally over the whole nation, north, south, east and west; and to build up Fairviews where they are not. To put a missionary of good farming in every county in every region in the United States is an epochal thing.

Unless this is done, however, the Smith-Lever Act will fail to do its duty. It is rather sad to see that the poorest regions in every state are the last to get this help—so that it still fails to reach the people who need it most. It might have been better, for instance, to have set Freeman Clay working in one of the twenty-three counties of Southern Illinois which, because they cannot pay their portions of the agents' salaries, have no county agents than to have had him sent to our county, where we were doing pretty well without him. Any educational law that succeeds where education is general and fails where it is needed is not altogether a perfect law.

So this will be about all from your Uncle Abner Dunham on the Fairview Idea. It is the greatest idea in the world. It relates to the improvement of the biggest business of all Big Business—farming. This is a business that has been all hands and no head. The Fairview Idea will give it head. It shows that the country church may be not only as good a church as that of the city, but a better one, we think, than any city can possibly produce. It shows that the rural school may be and ought to be a better school than any city school can possibly be. It shows that country life—poor and sordid as it usually is—may be richer and fuller than city life at its best.

Reforming Standpat Farmers

The Fairview Idea has the power to transmute a standpat farming reactionary into an agricultural progressive, with something of the apostolic in his heart. And why not? For ages society has taken bread from the farmer's hand and given him back a stone; from him it has received fishes and paid for them in serpents.



For many of us older people not much may be done; but think of the unending generations of little girls and boys coming on and on out of the fruitful womb of time to tread the furrows of America, to the end that a world may be fed and clothed! And to receive for these things—what? The sordid things, the false things and the useless things which have been given to them in the past? Or that vital enlightenment of which my New England ancestors must dimly have dreamed when they set up free institutions and free schools?

For the farm boys and girls of the future there must be justice and opportunity, according to the measure of the ages in which they are to live—opportunity to know, to live, and to seek the truth.

Some disquieting truth we have encountered in Fairview; but all truth is good. Even though we hook the Midgard Snake, still must we go on fishing in the ocean of human knowledge.

Whatever of change is necessary for the working out of justice as between Man and the Land is beyond me to say; but I feel sure that such changes as are essential can be made only by that farming people who really live and think, and by their living and thinking are brought to the envisagement of their own tremendous problems—the basic problems of the world; because they are the questions growing out of the relations of Man to the Planet out of which he comes, on which he lives and into which he dissolves.

The Fairview Idea, carried to its logical development, will give such a life to the farmers of the future. Where Truth leads is none of our business. It is ours to follow her unquestioningly, making sure first of one fact only—Is she really Truth?

Tire that doesn't need its guarantee

we conceived the idea of The General Tire, we had one great, big before us—

that tire users are no longer to be satisfied with adjustments for *under*-mileage; what they want is a tire that won't keep the manufacturer everlastingly in debt to them for more miles than the tire was ever built to deliver.

gned a tire to put tire buying and selling on mmercial basis. We figured your standpoint ed to make you buy the second General Tire ou liked the first one and not in order to l the mileage the first one failed to deliver. d the distributor's and dealer's standpoint ved to save them the constant hortened profits and worry that adjustments.

d from our own standpoint and calculation that adjustments and nts cost the manufacturer more an putting the right stuff into the e first place. Our figures showed ve could better afford to build a 5,500 miles and guarantee it for les than to build, guarantee and on a 3,500-mile basis.

mer is just exactly what we've The General Tire. Design, fabric, read, construction, treatment, cure one and all of these things selected e to make a strong, lively and d tire.

Double Protection by Guarantee and Quality

The service must be 5,000 miles or more—never less. The actual mileage is greater than the guarantee. The General distributors and dealers are anxious to protect your interests, because our liberal guarantee and unstinted quality protect theirs.

Guaranteed for 5,000 miles so you will have the knowledge that you are protected—but a guarantee you'll not be called upon to use. Owners everywhere are piling up 8,000, 10,000 and more miles.

Sold at a moderate—a very moderate price.

We've proved our whole theory by building a sound and solid national success in a year's time. We've proved it by the fact that the new General Tire dealers and distributors who have taken hold of the tire have done it not through wonderful salesmanship on our part, but because of the enthusiastic recommendation of other distributors to whom we have referred them. They all say "it stands up"—they couldn't and wouldn't say this if users hadn't found that it does stand up.

This is the kind of tire you want—viewed from every angle of economy of time, money and trouble.

The General costs less per guaranteed mile. Look up the General Dealer in your city—ask him to tell you honestly what he thinks of the tire. Then ask the price and be surprised.

(Continued from Page 5)

all is. With Mr. Harry Burnhart taking so little interest in things it makes it hard for any manager."

It cut Extell to the nerves to hear a word in extenuation of the man who had just discharged him. He went into a state of sulkiness, and to dispense gloom he blurted out:

"You seem to be a good deal interested in Vibert, Muriel!"

She reddened, but forgave him the words and the inference.

"I am interested in you—in us," she replied. "You won't stay in Milledgeville, will you, George?"

"Why not?" he snapped suspiciously.

"Why, because—because there's nothing here to keep you. There's only the paper mill. Surely you're going out into the world now, dear, to win! You ——"

"Listen, Muriel!" he broke in angrily. "I'm going to get even with Vibert some day! If it takes me as long as I live I'm going to get that man! I hate him as I never hated anything or anybody!"

"You will do something; you will make yourself big and strong and successful for your own sake—and for mine?" she replied, leaning toward him and putting her hands on his shoulders. "What do we care for him?"

"I'll advertise for a job in the trade journal next week!" he flashed. The girl looked at him in the eyes.

"As an advertising man?" she asked softly.

"Yes. Why not?" Something in her voice gave him a horrible suspicion. "You don't think as Vibert does?" he cried.

She was silent because she didn't dare to speak, but he rattled on:

"You do think as he does! Why didn't you say so? Afraid to hurt my feelings, I suppose! A lot Vibert knows about advertising! That's another proof that you're under his thumb, Muriel. I suppose you sit there, looking up at him ——"

"George!" she cried, springing up. "Don't—don't—please—we must go home! I—I know you are all wrought up. I know you don't mean what you say. But we must go—at once! We mustn't spoil everything. There are some things—some things that leave a scar that never heals, George! Come!"

They paddled back to the canoe house with hardly another word.

Extell inserted a rather colorless advertisement in a trade paper, as he said he would. He got one reply, and that came to nothing. A few weeks later he tried a New York daily newspaper. This elicited one response also; but after a brief correspondence he was told that, though they would keep him in mind, they had chosen a man with longer experience. The young fellow had the notion of packing up and going West, as Mr. Burnhart had hinted. Somehow he couldn't get started. He had been born in Milledgeville, and he had taken root.

For the first few weeks he felt a delicious sense of freedom. He made himself believe that he was overjoyed to see his old companions plodding to work when he could stay at home. Then he began to get restless. He began to hang round the Mansion House, planning, when he wasn't gossiping, how he should some day get even with Vibert.

Worse, Extell began to buttonhole his old associates on their way to and from work, and to talk loudly against Vibert. Some of the other employees, hating the manager just as cordially, baited him, drew him out, encouraged his venom, because they enjoyed hearing the tirades. He began to tell them how they could bother the manager.

Vibert heard all about this. One day he said to Muriel Clemm, just as they started some dictation:

"Your friend Extell is becoming a common nuisance, Miss Clemm."

The girl nearly fainted. The sneer tore into her heart because she knew it was the truth. She rallied and replied pointedly:

"I am ready to take dictation, Mr. Vibert."

On her birthday Muriel Clemm was amazed to find a leather-bound set of Shakspere on her desk when she came in. There was no inscription, but Vibert's engraved card was in the first volume. She did not

Electricity's Latest Gift

A complete Sewing Machine no larger than a Typewriter

The electric iron, washing machine and vacuum cleaner were great improvements on the old ways of doing things. Now comes this wonderfully compact electric sewing machine that you can carry in one hand—a full-size, high-grade machine without the unhandiness and unsightliness of the ordinary foot-power machine. No more need you tire yourself out pedaling. The

Western Electric Portable Sewing Machine

gives you one or a thousand stitches—for all day long, if you wish. The motor does the work. You simply regulate the speed by a light pressure of your foot on the control pedal. The price is less than you would pay for most any of the well-known makes of foot-power machines. Guaranteed 10 years.

Costs Only $35

($37 West of the Rockies)

If your lighting company, electric dealer or department store cannot show you this wonderful machine, send coupon to nearest office.

want to accept the gift, yet she didn't know how to refuse. Finally she thanked the manager, and for the first time since she had worked in the office he showed a real human gleam in his eye as he replied:

"Not at all, Miss Clemm. Your work has been splendid this past year. You don't know how much you help me in my work. I hoped you would accept the little gift in the spirit it was given."

That same day she went home feeling sure that there would be some trifle from George Extell, as in five birthdays past, that she could accept in a far different spirit. But this time Extell had forgotten.

Extell called upon Muriel one night, and almost immediately started on the usual string. He began to tell her, with a great deal of relish, how Arthur Goodwin, one of the clerks in the credit department, had clashed with Vibert and threatened to punch him. The girl stopped him short. Her lips came together with a new firmness, and something altogether new spoke to him from her eyes.

"I don't want to hear it, George!" she exclaimed. "I want to hear nothing more about Mr. Vibert."

He glared at the girl, stupefied.

"You don't know what it means to me to say this, George," she went on with a little shudder of her lower lip. "I must say it. I shall not see you any more, George—while you remain here in Milledgeville. It does you harm and it will drive me mad. I have tried and tried—and you won't let me help you. They are laughing at you—everybody; the people in the office talk shamefully about you behind your back. I thought you were going away from here to fight your way to something fine. I know it is in you; I believe in you; I shall—I shall believe in you. But you must go away. I—forgive me, forgive me if I hurt you; I am hurting myself more. Yes, come once more—the day before you go away—once more."

"You don't want to see me?" he gasped pitiably.

"I want to see you succeed. I want to see you do something well. Anything, George—but well. Good night!"

Extell literally staggered as he went down the steps. The air choked him. He began to walk. There was no moon, and when he got beyond the lighted section of the village he stumbled along; but he did ten miles of fast hiking before he got back to his room. The film fell from his eyes as he walked. Some stoppage of his brain gave way, and he began to see things in their true perspective. And for the first time since Vibert had turned him loose he saw Muriel Clemm, not as a woman to approach for petting but as a woman to fight for, to strive for, to be worthy of.

With a frantic and clumsy-handed joy he lighted the lamp in his room and began to pack.

At seven o'clock, feeling fresh in spite of his sleepless night, Extell was ready. He called a truckman for his trunk, locked his suit case, and swinging it in his hand with a buoyant grip and stride, he went over to the Clemm house and got there just as Muriel was rising from the breakfast table.

Like lightning she caught the welcome news. He didn't tell her; he didn't need to. She bounded toward him with a sunrise of joy radiating from her beautiful face.

"Where?" she whispered.

"Chicago."

"This morning?"

"Yes, I'll catch the eight twenty-nine for Springhaven and get the Southwestern Express."

Muriel Clemm seized her hand bag from the mantel of the sitting room and opened it with thumby fingers.

"Here!" she said. "Take this envelope, George. I wrote it—the week you left the office. I knew the time would come to give it to you. See, it is sealed. I want you to put it away where it will be always safe, and I want you to open it the day you know you have made good. Will you promise me—you will, won't you? 'Not to be opened'—see, I have written on the envelope!—'not to be opened till George Extell knows that he has conquered!' Don't think I mean that you must make a lot of money! It isn't that at all! You know what I mean—the day you feel that you have won."

"Good-by, Muriel," he said gently. "I love you!"

II

THE sales manager of the South Trent Tool Company looked up at the young man who had just been admitted to the office. He held a card between a thumb and forefinger, and scanned the new face for surface indications. But in that swift, businesslike assay there was no sign of suspicion or preconceived judgment. Instead, the sales manager looked at George Extell, as he looked at all the candidates for jobs, with the hopefulness and interest of a man who is constantly saying to himself "This may be the man we want!"

Extell felt it. And when the sales manager, instead of uttering a cold "What can I do for you?"—which is the deadliest gas ever emitted upon enthusiasm—said "How d'ye do, Mr. Extell; pull up a chair!" the stranger felt a powerful desire to leap forward and grip the other man's hand.

"You are with the Eclipse people," went on the sales manager, glancing at the card again.

"I was," corrected Extell. "I'm not now. I am here looking for a job."

"I haven't anything to do with the advertising department——" the sales manager was saying, when Extell interrupted.

"I'm not looking for that kind of a job," he explained. "I want to sell." Mr. Wetterson nodded.

"Good!" he said. "That's more in my line. How did you happen to leave the Eclipse people, Mr. Extell?"

The visitor's face almost matched the dark red varnish on the walls; but he replied with the promptness of a man who wants an ugly task over and done with:

"I was fired."

Extell half expected to hear the words, "Sorry; good day!" as a result of his painful veracity. Indeed, Mr. Wetterson's eyebrows elevated somewhat, but he added simply:

"Do you mind telling me just how it happened, Mr. Extell? I assure you of absolute confidence. It might not be important anyway. Very good men have been fired. Er—I was fired myself once. Good thing too!"

"I was fired for incompetence," replied Extell gravely.

Mr. Wetterson's eyebrows reacted unconsciously. He smiled slightly and suggested:

"That is, Mr. Extell, the man who fired you told you that?"

"No, sir; I was incompetent. I didn't realize it at the time. I see it now. I couldn't have been anything else."

It wasn't the unusual method of approach that held Wetterson's attention. He was justly suspicious of unusual methods of approach. He knew perfectly well that the unusual had become the usual, that too many men were now aware of the effectiveness of surprise, in getting their wares before him. Only a week before an insurance solicitor put his elbow through the frosted glass of his door—and sold him a five thousand dollar policy on the strength of the introduction that his apologies secured. He had had prospective salesmen deliver orations on selling efficiency that held him spellbound—until they got on the pay roll; and he had had them speak of themselves with the humility of Trappists and prove just as productive. But there was something else about Extell—something even besides his clean, healthy exterior and priceless youth—something of just plain, old-fashioned, trite honesty unadorned. Wetterson said:

"Have you ever sold tools?"

"No, sir."

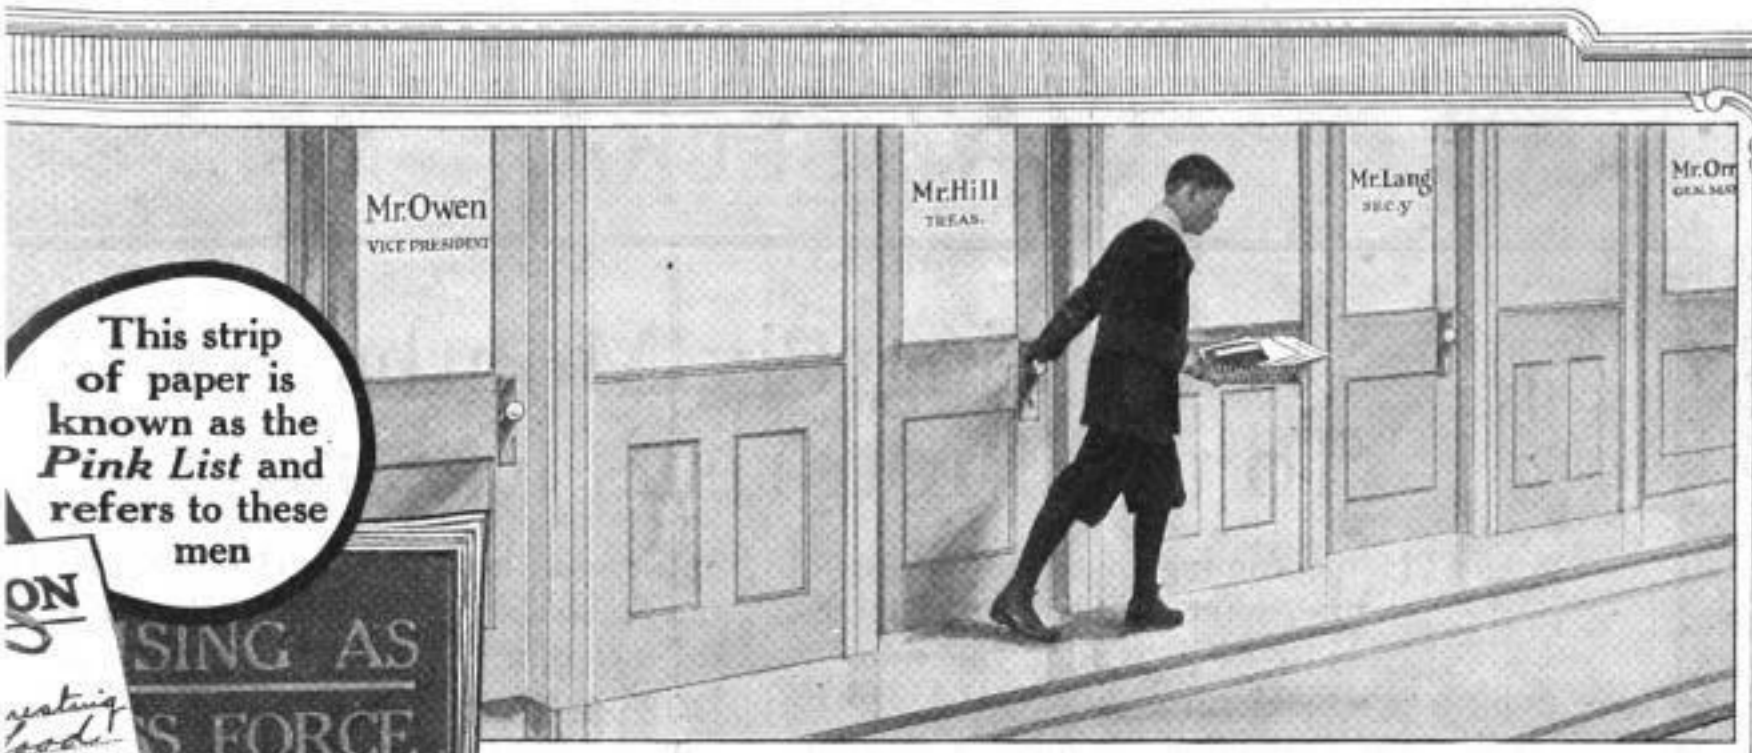
"What makes you think you can?"

It was a challenge, and a fair challenge. Extell hesitated just a moment. Then he replied:

"Mr. Wetterson, I've got to sell goods. I know I can. I'm on my toes. I don't think about anything else. There are some things I can't explain, but those things will make me sell."

Wetterson smiled, but not deprecatingly. He wasn't impressed by Extell's words; he was impressed by his manner. Such words he had heard before a hundred times. The manner was somehow refreshingly new.

"Naturally you want to stick to tools," he said. "That's right too. You know something about them. By the way, Mr. Extell, tell me something very frankly, will you? What is your opinion of the Eclipse mechanical tools?"



The truth fairly spurted from Extell's lips. With the fervor of a devotee he replied:

"Mr. Wetterson, the Eclipse tools are as fine as anything produced in the world. They are made absolutely on honor. I was with them five years nearly, and I never

"Send this to the Pink List"

You often receive a booklet, a letter, a circular or a newspaper item that is of interest to your business associates. Do they see it—promptly?

They do, if you use a special form like the one shown here. You say to your stenographer, "Send this booklet to the pink list" (if the forms are pink). Every man on that list sees the booklet and then it comes back to you.

The value of these little "pink list" slips is not so much that they make it easier to route worth-while information about your office. The point is that without some such device you simply don't send your associates a lot of things you would like them to see. You can have other slips of different colors for different lists of men.

Perhaps you will have to try out this little convenience to find out what a genuine help it is.

That is not difficult. Any printer can supply these slips at a small cost.

Too many firms make a job of buying printing, when it is really an easy matter.

Tell your printer you want to standardize all your office forms on Hammermill Bond, and he will do the rest. He knows Hammermill Bond, knows where he can get it and how much it will cost.

Begin to use Hammermill Bond, in bond, ripple or linen finish, in white or in any of the 12 colors, for all your office requirements, and buying printing becomes an easy and economical operation in which you and your printer work in accord.

We have prepared special sample portfolios of Hammermill Bond, a portfolio for each general class of business—hotels, banks, insurance companies, retail stores, professional men and so on. Let us send you, free, the portfolio that applies to your particular business.

Printers have found complete sets of these portfolios very useful in soliciting business, because they offer suggestions to the customer. Any printer may have the complete set.

o work for. . . .

Yes, George, your letter made me so glad—and yet it hurt me a little too. Do you know how? Oh, my dear boy, won't you please, *please* put Mr. Vibert out of your head forever? Can't you consider it as something that never happened? It is only that I am so afraid that this feeling of revenge will hurt you in your work. And that somehow it may grow and grow and finally eat into your very being. What do you care for him?" . . .

"She may be right," said Extell after reading Muriel's letter, "but she doesn't understand how deep that feeling goes. However, I won't mention him to her again. But, by heavens, I'll get him some day sure!"

Extell was one of those men who seem born never to entertain a grudge against anyone alive; and who, having once decidedly found a hatred, follow it with blind, amateur fury. He went into the South Trent factory with his teeth clenched. He clenched them so hard that the keen-eyed Wetterson, meeting him one day, slapped him on the shoulder and said:

"Extell, don't plug too hard. Don't wear yourself out. You'll need energy later. Smile a little, old man, once in a while."

Another time: "Extell, you're a kind of mystery. What's behind that grim deathness of yours anyway? Well, never mind; whatever it is, it looks as if it might put you over. But try to smile, Extell!"

Extell shouldn't have found it hard to smile in those surroundings. The Eclipse environment had—excepting Vibert—been polite, virtuous, but cold. Here there was warmth, a radiation of good fellowship that seemed to come down from the top of the organization, to accumulate hearty interest as it was fanned through all the departments. The newcomer felt it from the first day, when the big Swedish-American factory superintendent, Dahl, took him into his enormous paws. He got a breath of it from Erb, the advertising man, who came to him in the factory one day with a proof in his hand, and said:

"I say, Extell, you were advertising man over there. Look at this, will you, and tell me what you think of it?"

The request brought color to Extell's cheeks. He wondered, with a sort of shame, whether he would have been similarly capable of asking advice when he was in Milledgeville.

So in the latter part of 1912 George Extell was, for the first time in his life, honestly striving, keeping everlastingly at it, spending three evenings out of seven in reading, studying, planning. He had a tremendous driving force behind him. He did not inquire of himself exactly how this driving force was made up. He thought it was due to his solemn oath to get even with Vibert in some way as yet obscure. Whenever he thought of his old manager his muscles tightened and his nerves strained.

In October Wetterson stopped Extell in the hall one morning just as he was punching in. He took the young fellow into his room and sat him down.

"Extell," he said, "you go on the road Monday. The rest of the week you can spend with our Mr. Preston, who is correspondent for your territory, and with our topnotch man in the Southern New England district, who is in the office just now. I'll introduce you to him this morning.

"I want to say just a few words, Extell. I'm giving you a hard territory with a lot of hurdles in it. The man who has had it is getting through. He has done little with it, and I don't hold him altogether responsible. Really I'd like to start you off on something more promising; but there isn't another vacancy. You're going to find the going hard, and at times you're going to get as blue as this typewriter ribbon. I know how it is, and you may as well know. I think you've got sense enough so you won't be hurt by hearing this in advance.

"Extell, you've seen our line. I tell you, South Trent tools can't be beaten in this world for mechanical perfection. You've caught our atmosphere, here in the office, and you can see that we deal square—absolutely on the level. I want every one of my men to go out and talk our tools from an honest belief in them. I want them to feel that, all things considered, they are the best in the wide world. But if I should ever hear that you walked into a place and knocked our rivals, Extell—even by innuendo—well, son, I'd take the first train and wring your neck! Good luck to you!"

(TO BE CONCLUDED)

They Wouldn't Even Buy Shoes for Her!

Marguerite Clark
in "Snow White"

There was an envious stepmother, and a beautiful princess, and seven dwarfs, and the most gallant knight that ever was. And they make a beautiful story—a story with the very spirit of fairyland. Of course, it is a Paramount picture. Marguerite Clark appears exclusively in Paramount Pictures. She is the spirit of everlasting youth, so eagerly welcomed by so many thousands of men and women and children when her lovely face and tiny figure flash out on the screen!

LOOK FOR MARGUERITE CLARK in these Paramount Pictures—"The Fortunes of Fifi," by Mollie Elliot Seawell; and in "Cinders," "Miss George Washington," "Little Lady Eileen," "Mice and Men," "The Prince and the Pauper," "Molly Make-Believe"—and many others. And see these other Paramount Pictures—"Oliver Twist," "Great Expectations," "The Slave Market." These and "Snow White" are some of the

Paramount Pictures

Paramount Pictures are produced by four companies—Famous Players—Lasky—Morosco—Pallas. If you see one of these names you know it is a Paramount Picture.

You know now, that when the bill board in front of the motion picture house shows a *Paramount Picture*, you are going to see a good play and a great star. You know that the Paramount theatre in your neighborhood is the best theatre.

This is no accident. It is the result of many long years of careful effort and much struggle. For the *Paramount Producers* were the first who made motion pictures of quality and always of a clean, wholesome character. They were the first to put Sarah Bernhardt and other great stage stars in the films. They were the first to feature five reel photoplays. They knew from the first that nothing was too good for the motion picture.

Here are some of the many Paramount Stars:

Marguerite Clark, Pauline Frederick, Marie Doro, Fannie Ward, Mme. Petrova, Margaret Illington, Lenore Ulrich, Mae Murray, Louise Huff, Kathlyn Williams, Ann Pennington, Vivian Martin, Myrtle Stedman, Cleo Ridgely, Theodore Roberts, George Beban, Lou-Tellegen, Jack Pickford, Sessue Hayakawa.

THE HOUSE OF CRAIGENSIDE

(Continued from Page 23)

"I feel all gone," she whispered. "Something has taken the starch out of me."

She drank, then motioned the girl to take away from the bed the copper warming pan, in which a handful of coals still glowed red.

"Shift the rolls," she said then, shrill as a parrot.

These rolls were rolls of sand bound in red cloth, like huge window bags, one on each side of her. They seemed to be all that kept her tortured body together in the bed. The girl shifted them.

"Hear the wind," said the old lady between her teeth. "It comes against this old rattletrap like a judgment—like a judgment, young man."

The girl left the room with the empty glass, and Mercy turned on me a glittering eye.

"Come straight from the shoulder and no shillyshallying," she said to me. "Prevarication kills me quicker than anything in the world. I won't hear to it. A track was seen in the sand, you said?"

"I saw it with my own eyes this afternoon."

Fear stood in her black eye.

"With your own eye. And no foot that could have made it, I suppose? You saw nothing that you could have put your hand on?"

"There is no reason to start," I said soothingly. "I have good reason to believe that no ghost made it."

"No ghost, I'll be bound," said the old lady faintly. "Better a thousand times if it was a ghost. No, it was no ghost of Amos."

I leaned forward eagerly:

"Then you yourself know who it was?"

"And suppose I do?" shrilled old Mercy. "What does all my knowledge avail me, now that I come to the judgment seat? What was all my nursing him and waiting on him by inches, the great spleeny man? I worked my fingers to the bone, I slaved like a dog, and what was my reward? To embalm him, if you please! That was his will and pleasure—that was what he could find it in his heart to leave me as a legacy. I've heard him say, young man, that women like to be martyred. That was the theory he went on; and so he went and consorted as he chose, and left me to pickle him and bring him home here away from the clutch of foreign hells."

She muttered unintelligible words, then said clearly: "He's well preserved—I had the embalming of him myself. It's a trade like any other, and I learnt it young. 'Bring your tools, Mercy,' he said to me. 'If you must come, bring your devil's chemicals. I shan't be easy unless I'm under those sand dunes. Some day they'll pile over the tomb and hold the secrets of the Craigensides safe.'"

She paused for breath; then went on:

"He was afraid of his little idol, though he wouldn't admit it. Oh, don't tell me they're only wood and stone, these foreign gods! They are wicked contraptions, I don't care if they are carved by hand of man."

Her blue fist was knotted in the sheet.

"I've never known one peaceful hour since the day he brought the thing aboard."

"Where was that then?" I inquired.

"That was in the China seas, young man."

Then she lost the thread of things again. When next she spoke intelligibly, she said:

"Hark! Do you hear the wind over the dunes? So I heard it when I was a child, but it changes its tune. Ah, the air is sweet. Raise the window higher. Let the wind come in on my face. I'm burning up! No, shut it again. Shut it down. Hogs hate wind; but no more than humans, when the soul is blown along too. I felt it snatch at me. Ah, well, I'm going with the ebb . . . with the ebb . . . with the ebb . . ."

Her words became an unmeaning drabble of sound. They ceased. I leaned closer, thinking she had gone already. She still breathed. Through the closed window I glimpsed the ceaseless glitter of the outrushing tide, on which the moon had cast sharp silver spurs. With the ebb?

But the ebb was not yet consummated. The old lady gave vent to that shuddering sigh which, as she said herself, was of such a character that with each repetition it withdrew a drop of blood from the heart.

"Works, that's what it is, plain works," she mumbled. "For shame! Oh, if there's one thing more than another that just about kills me, it's ingratitude. I can do and do for you and bear and bear with you and slave and work like a dog and wear my fingers to the bone, and not one single, solitary thing will you do for me in return."

She grew wrathful, rose up between her sand rolls and beat the quilt feebly.

"I will not bear with that demon lurking there. . . . Hear the man. . . . Unreasonable. . . . To save myself . . . from the clutches. . . . All my life, fair weather and foul . . . without a murmur of complaint . . . and now . . . unreasonable. . . . Look there at the thing he has set to watch over me in my misery; its eyes follow me in my turnings and tossings. Oh dear, it's awful to face, cast up red hot out of hell. . . . There, there . . . the ship shudders. . . . What's that sharp noise forward? . . . Take the deck, man . . . we shall go down with all our sins if we are not precious careful."

All at once this fit was over; the old lady looked at me with sane eyes, and murmured:

"'Man giveth up the ghost, and where is he?'"

Immediately she relapsed into her harangue:

"I counsel you to drop it where the ocean's deepest. Why should you fear cold stone? Ha, why indeed? You are too bold by half. Bend it toward you, as he says. . . . No, no."

These words came as a wild screech.

An extraordinary light had come into the old lady's black eyes. She rose half up in bed, beating the quilt feebly; and then the most terrible delusion of those who die was all about her.

"My feet take hold on hell!" she shrieked.

I affirm to you that it was possible to see the flames consuming her; she shriveled before my eyes like an ant laid on the coals, and with a shiver I reflected that indeed her feet were gone already. She writhed between the two great sand rolls, and the agony of all historic fiends was comprehensible to me thenceforward. Her cane with the albatross beak appeared from under the quilt, its jaws gaping side by side with hers, as if in a queer, headless sympathy.

I was conscious of the sane appointments of that little chamber—the great four-poster bed, the chintz-covered wood box, the frayed samplers on the walls, the leaky bellows by the chimney place, the low-seated horsehair chair. These things gave the place a look worn and habitual. Yet under my eyes lay a soul suffering the torments of the damned, to whom all this had become remote and chimerical, whose ear had no receptivity unless for the dreaming voice of the tide, which ebbed, ebbed, soliciting her spirit into that dark ocean with its immeasurable voice, that mystery beyond solution.

Mercy Cobb fell back, and the light of reason stood in her eye again. I looked furtively at the lump of clay at the foot of the bed. Could she see it also? Alas, poor lady, thus flies are smeared! Death knows nothing of fastidiousness.

"There you are again," she whispered.

I stooped and adjusted the rolls. The sand itself had absorbed the burning heat of her shriveled body.

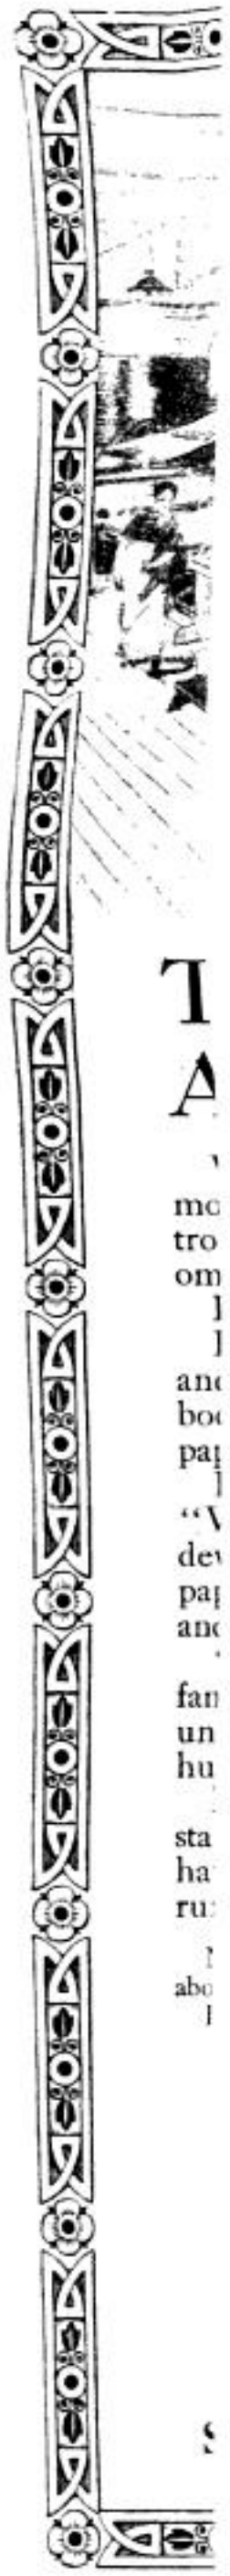
"Hark! Is that the gulls beating about the house?"

It was only the tide with its many urgent voices.

"But still they'll wheel and wheel—they're never satisfied. . . . Lost souls. . . . There's the wind again, trampling on the roof. . . . Many the time I've thought it would shoulder this house into the sea. But no, it is founded on a rock. . . . Listen again! Isn't that they, coming against the wind?"

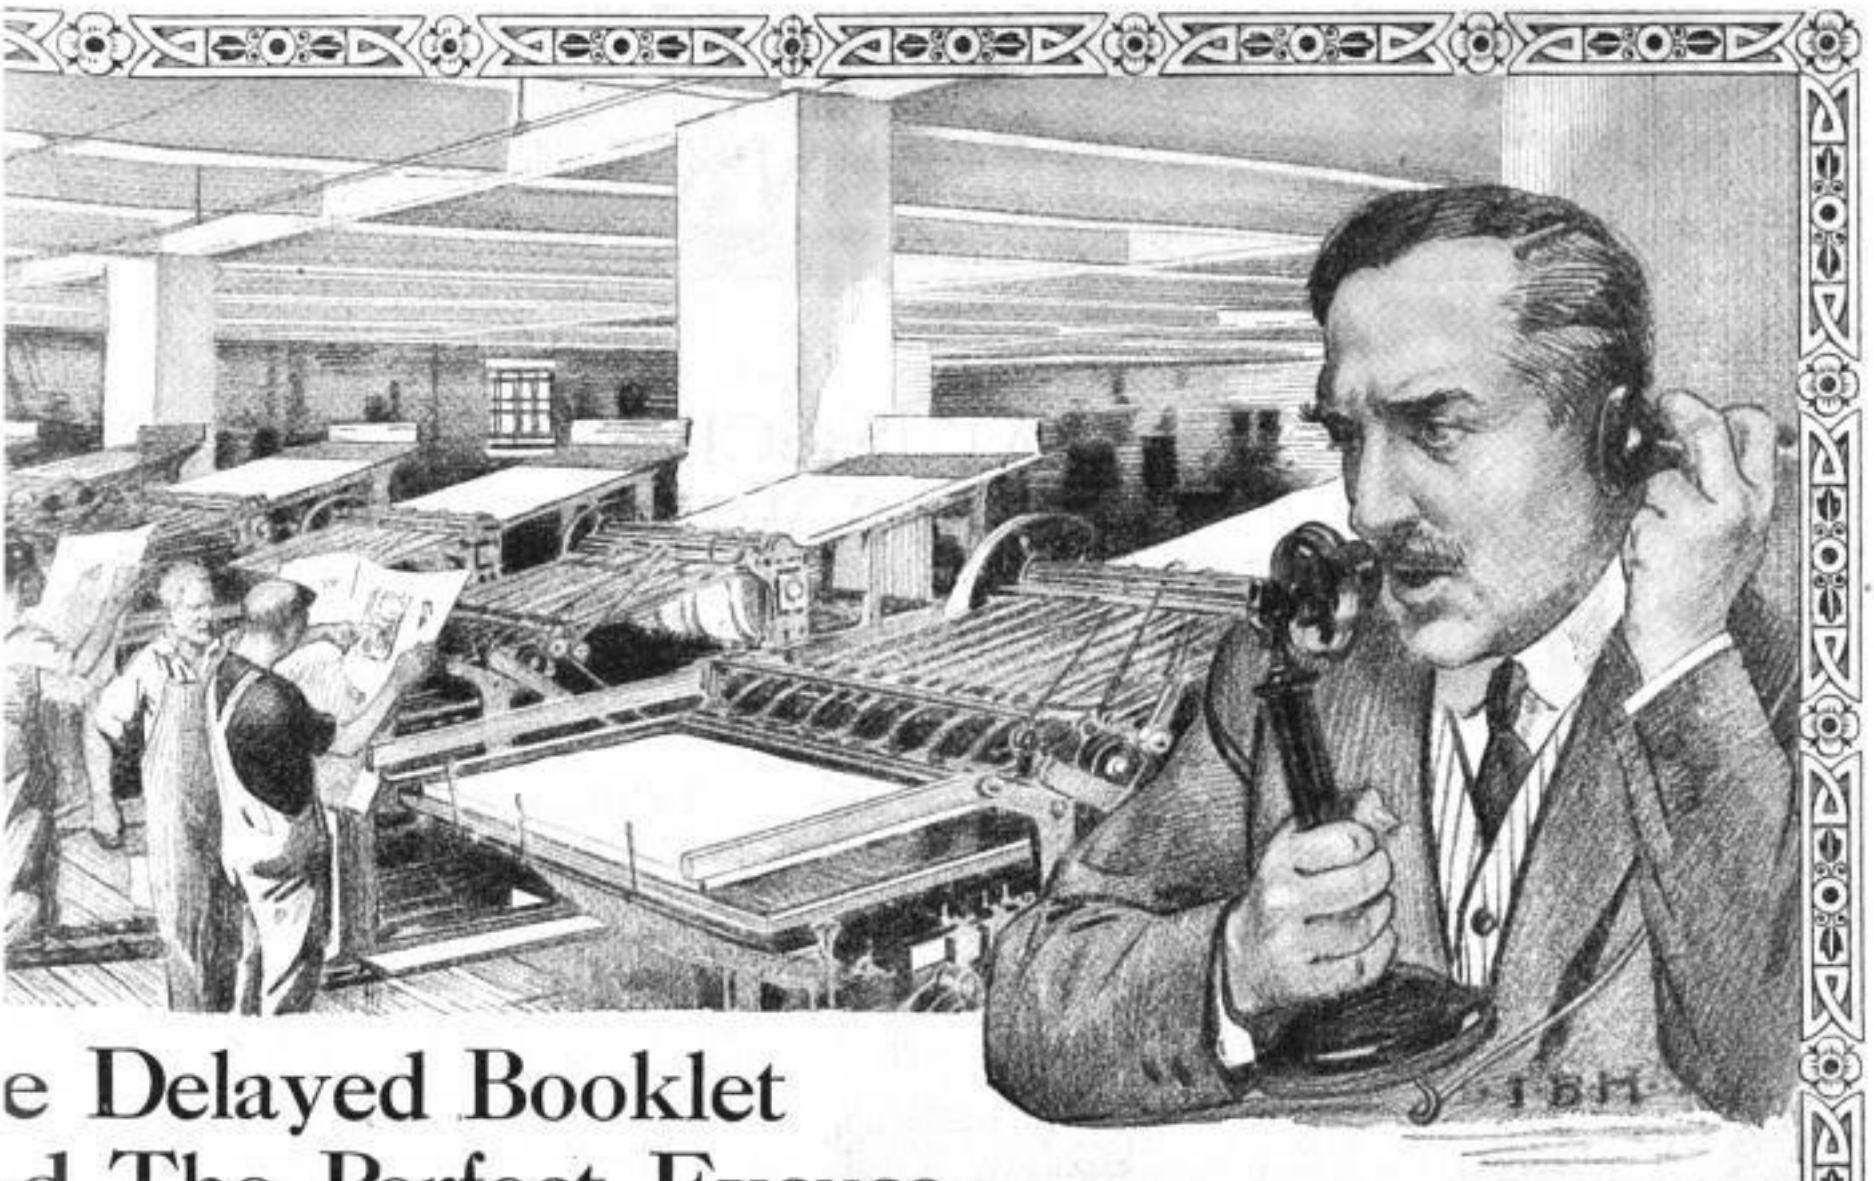
Her eyes blazed; a sort of madness seized her.

"Yes, yes! Here's the one that was hanged. Just God, the hangman's noose is at my neck! Ah, I have done no wrong, but there it is, seven fat turns of the rope round a standing part. It comes nearer. Drive off the bird. . . . Now, hold off. . . . God's mercy, I confess . . . give me time."



"Confess," I whispered. "And to what?"

But a saner light had come into her eye.



"Young man, I charge you, upon your conscience, bring me the god . . . the little jade . . . here to my bedside. In half an hour it may be too late. Oh, to be plunged at my latest hour into the furnace of adversity, as I am! It is more than I should bear!"

Her fingers were actually at my wrist. Wild terror gave that skeleton hand invincible strength.

e Delayed Booklet d The Perfect Excuse

n the telephone rang that g I was apprehensive of . There was something is in the tone of the bell. is my printer on the wire. iad finished his make-ready rted his presses on my new —and the coating of the iad "picked."

iry (I am afraid I said, do you mean 'picked'?") ed that the coating of the stuck to the halftone cuts lled off.

n't you fix it?"—the old, r wail went over the wire, ssarily loud, for I was in a for that booklet.

the paper was not up to d. The entire order would be thrown out and a new paper secured.

day the printer told me something inting papers.

ms that not only the "picking" of cuts, but binding troubles, blotched engravings, some booklets actually weighing more than others, with consequent variations in the way individual pages are printed, folders and circulars that break in the mail, blistered pages, shrunken wrinkled sheets—all these deviltries are due to lack of standardization in the making of paper.

A standardized paper is one that invariably gives uniform results under the same press-room conditions.

Good printing depends upon a perfect co-ordination of three factors: the press, the paper and the cuts.

Just as the speed of a press is standard; just as the number of separations to an inch in a halftone cut is standardized—so must there be a definite weight, thickness, color, surface and body to the paper that is to run on those presses and which is to record impressions from those cuts.

Variations in paper mean variations in printing. Definite standards in paper mean definite standards in printing.

If you want fine printing, you must work with standard papers.

S. D. Warren & Company were the first to realize the importance of standardized printing papers and the first to set about producing them. Their announcement of Warren's Standard Printing Papers gave better printing to America by establishing a basic standard for the kind of paper to be used in the printing you contemplate.

The 1917 Warren Suggestion Book shows you all of Warren's Standard Papers, and suggests when to use them.

It shows you when to use the lustreless, ivory-like CAMEO that gives to halftones the depth and softness of platinum photographs, and the glowing WARREN'S LUSTRO, the highest refinement of surface in glossy, coated papers.

It shows you how WARREN'S SILKOTE brings out the fine detail of illustrations of either commercial or artistic subjects. You see the remarkable effects obtainable on the dignified, clear-printing CUMBERLAND COATED. WARREN'S PRINTONE for large editions, a good-looking, perfect-folding paper, "better than super, cheaper than coated," is also shown and the best uses described.

Write on your business letterhead for the 1917 Warren Suggestion Book, seventy-two pages that are a real, constructive help to any buyer of printing. It and supplementary booklets are free. If you buy printing they will be useful (we almost say indispensable) to you. They are text-books on paper for those who use it.

ired our quarry.

"A slave room—in this Northern state?" I protested.

"My dear sir, this is a Queen Anne house, and its Queen Anne owner would certainly have held slaves, even in this Northern state."

"Wait, did you hear a step outside?" said the man—or mechanism—recoiling with a ghastly face, but still holding the god rigidly erect.

We stood listening with all our ears; but there was no sound. The girl below, we later learned, frightened by the sound of strange voices, had fled the house.

"I hear nothing," said Hawley. "And now, sir, will you be good enough to explain to us how it comes that you haunt an old lady's last hours in this disgraceful fashion? Upon my word, by the look of things it is fair to presume that you have been the death of her."

"Turn and turn about," said the man in scarlet. "She has taken ten years off my life in times past. But it was her own conscience that killed her, and the memory of—this."

He tapped the pug-nosed god affectionately on the end of its most characteristic feature.

"I may say," he continued, "that she had in a measure got into the habit of bowing down to sticks and stones. She is now dead. God rest her! I say it from my heart, though I have reason and to spare to be bitter against her. She had a hard row to hoe at the last. This thing had had its unholy eye on her all along, for all she was a Methodist. The truth is, she is responsible for its having been—transplanted. The East and the West are here weirdly mixed up. No, if you value your life, sir, do not touch this thing until I have verified once and for all the suspicion I have of it."

Again his jaw hung slack, and again he listened, as if to the low breathing of some far-off menace.

"Do you know," he said, "I believe there is no time to lose."

He seized my arm, urging me toward the door.

"As I live, there's deviltry in the air, and of a kind I am familiar enough with by now, in all conscience," he said. "Come with me, if you please, to the other house."

"We expect an explanation in due time," said Hawley.

"In due time you shall have it. I suppose we may leave her alone upstairs. She no longer needs an attendant."

But at the very door we met Doctor Starr, dangling in his fist a small pine box in which he had intended to pack that lump of clay.

"You will have to bring a larger box than that," said Hawley gently in passing out. "Your patient is dead."

"It is the best that God could do for her," said the doctor quietly.

"That is mortal truth, I can swear to it," said our man, "after the time I have put in in that closet of hers."

As we leaped the wall which bounded the Craigenside terraces he told us that he was a sailor, by name Jim Garnett.

"You will not have heard of me," he added. "I went away when a boy, and I've never been back; but I was born on this sand spit for all that, and my feet can still feel it out for me."

He put back a restraining hand as we crept into the shadow of the house.

All was dark and still. In another moment we were between the central pillars of that wide-flagged porch. A cool stir of air came from the river; and then we received into our nostrils that strange suggestion of spice from the huge musty hall which had first drawn my attention to its Oriental flavor. Starshine struck a sparkle from that robust mermaid of brass affixed as a knocker to the center of the panel; and immediately I saw that the door itself stood ajar.

The scarlet figure at my side reached out a hand and brought down the knocker three times. The portentous dwelling of the Craigensides gave out no answer and no stir of life. It seemed absolutely empty, and there was not a sound except a slow dropping of water in some hollow place which gave out a minute echo. From where we stood we could see through darkness a faint spur of light on the silvered knob of the door which opened into the front parlor; but beyond this, nothing.

My friend therefore opened the door wider, and said in a distressed way:

"I believe they have gone already. Is it possible ——"

He twisted his head sharply and made sure that the ship was still lying at her anchorage. The moon had gone behind a cloud,

EVERY year an increasing number of people, who have had experiences like the above, come to the same belated conclusion.

The average building put up today should last for one or two generations. But too often the pipe which goes into it is purchased on price only, and begins to give trouble within a decade, followed by replacement at a heavy cost before the building has reached its middle age. The best way to forestall such trouble is to insist when the plans are being drawn, on

BYERS PIPE

GENUINE WROUGHT IRON
FULL WEIGHT GUARANTEED

For Byers pipe is made from genuine hand-puddled wrought iron—the kind of iron which has for centuries been known for its rust-resistance and ability to withstand vibration, shocks, expansion, and other physical stresses which soon undermine the strength of pipe made from newer and only slightly cheaper metals.

Byers pipe, black or galvanized, has for half a century been the standard for plumbing, heating and power purposes in the best residences, large buildings, factories, mines, power plants, on railroad cars, locomotives, in short wherever the greatest permanency is desired. Its slightly higher first cost is but a small premium to pay for the most permanent pipe insurance.

but the Asphodel's riding light was plainly visible, and something like the ghostly shadow of the ship itself extended on the dark surface of the water.

"The Asphodel," he murmured; "pale flower of Hades and the dead. Well named, choice flower of hell! Do you know it is true that a ship takes the complexion of her company? The very shrouds and shadows may take on that tinge of the murderous and treasonable. I tell you, when I look at that ship, lying there—the very ship that I saw lost in the fires of sunset—gone like morning mist or like a chip on the tide, I feel as if a cold wind had passed through my heart."

"The ship then enters in?"

"You may say that. I suppose as a ship is hung up, rib by rib, bolt by bolt, yard by yard, so she goes. The song of the mallets that drove the oakum into the seams of the Asphodel was a dirge, however. Have you a match? No matter; there comes the moon again."

He opened the lid of the tall clock and replaced the god on its shelf. The eyes, appearing as two venomous sparks of green fire, favored us with a horrid scrutiny.

Jim Garnett loomed close in his bizarre costume. Suddenly his fingers banded themselves like steel about my upper arm, and he hissed:

"Did you hear that noise? Something between a wail and a whistle?"

I had heard it certainly, and for a second had indulged a spasm of fright. But the cause of it had instantly occurred to me.

"They are setting off the fireworks," I said. "That was the stick of a stray rocket falling hereabouts."

I stepped to the door, and in that moment the sky was rent by the splay colors of a triple bomb. Great golden fingers hung for an instant high over that dark house, reaching down as if to whirl it away in the clutch of that mad phantasmagoria which linked it with the vengeance of unknown gods.

Jim Garnett sank his fingers in my shoulder.

"They are coming—from the waterside," he whispered. "Now you shall see a curious thing. Look! I leave the lid of the clock open. The moon will shine into the face of the thing in another second. Come this way, into the double parlors."

We fell back into the musty darkness of those huge rooms; and in another moment Craigenside appeared on the porch, and the girl behind him. "You see, there is nothing," she was saying softly.

"I felt the tug of the thing, I tell you," he insisted in a weary voice, "as much as if some cursed anaconda had got me round the middle. It caught me here. I was as numb as an oyster for a second, then I felt something like a warm wave dart up from my heels, do you understand, and then—— Merciful God, the thing is back!"

We saw him, with his arms hanging limp, stop and stare. He crept toward the coffin, whispering "There is something devilish in this reappearance."

The tall clock was now plainly discernible in its corner, and Craigenside fixed a terror-stricken eye on its infernal occupant.

"Fancy or no fancy, I am a doomed man," he said thickly.

"No, no," said the girl. "If we keep a strict watch, what harm can come to us?"

"Watch?" cried the captain fiercely. "What is there to watch? You know this religion as well as I do. Every act of a man's life follows him, and climbs his back like his shadow—his shadow—his shadow ——"

He went on with his mad muttering. He stole toward the masked horror in the corner, reached out an arm, drew it back.

"The sins of the fathers," he whispered. "Was it my fault? I felt in my bones that no good would come of that hell's opening. But he would have it, and so all of us must pay the shot."

The girl tried to pluck him back, making at the same time a movement to shut the door of the clock.

"Let be," said Ruel. "Time and Eternity! Time and Eternity! So it goes with the house of Craigenside—divided against itself. Hah! Tick, tick, tick, so you go—the sand running in the glass."

Then, in a flash, followed a dreadful series of events. Craigenside, swaying in his tracks, drew one hand across his brow.

"He is coming," he muttered. "He is here already. The summons ——"

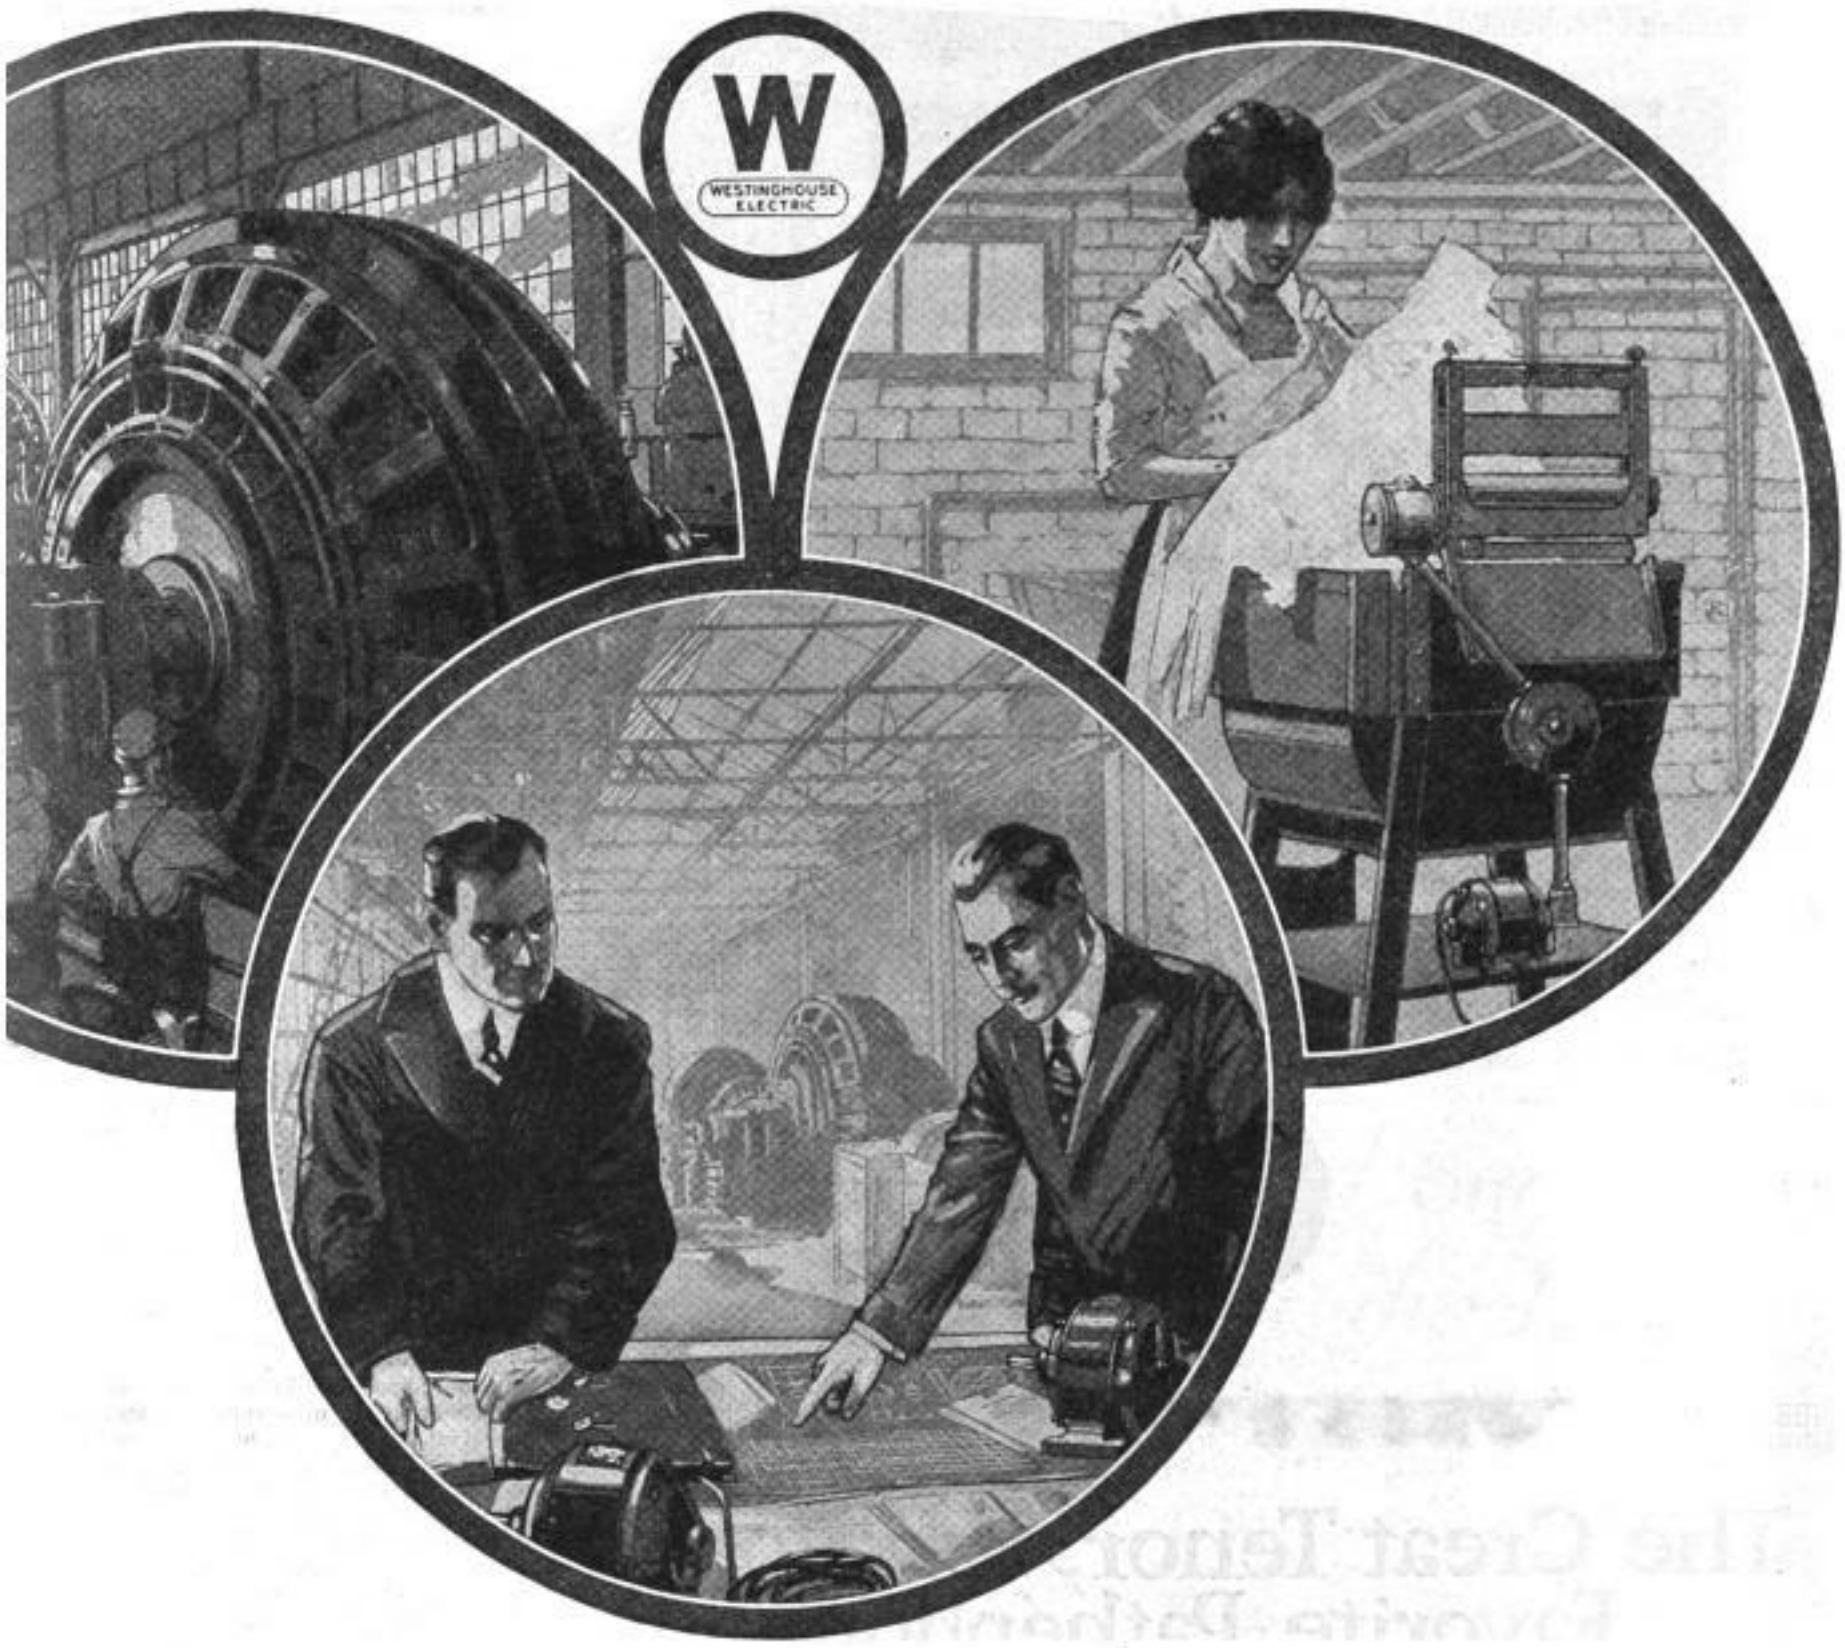
He fell to his knees, and his hands clawed at the rug. The ropy shadows of the invisible retribution seemed to be knotted at his throat already.

It was precisely then that we heard a roaring on the roof of the house, and saw the night sky taking a red tinge. That rocket whose whistling we had heard had fallen through the skylight into the attic and set fire to the heap of dusty rubbish there. The house was open from top to bottom, and with the draft thus afforded the flames had a fatal hold in a twinkling.

It may have been this threat of ruin that drew Mr. James Smith out of his hiding place. At all events, he came. We saw his black figure pause on the threshold, that terrible pale eye of his fastened on the god. He had come far and schemed a great deal to possess it; but after all he was doomed to disappointment. He stood with folded arms, the lump on his forehead glowing scarlet. I think we were all affected by glancing rays of his strange mesmeric power. A sleepy veil seemed to hang between our eyes and that impending horror. That extraordinary yellow mortal was terrifying in his economy of movement. It was as if the soul within had stationed itself a thousand miles away. That stillness in the body was like a projection in the flesh of the terrible steadfastness of purpose held within. The man seemed to live by one thought, and to await the revolution of the wheel of things to bring uppermost his opportunity.

Jane Craigenside was first to rouse herself. With a cry between disgust and fear she stepped back, and with a convulsive movement of her arm flung into that ghastly black box a heavy dagger—sheath and all—which she had ripped from the draperies behind her. All her valiant soul went into the throw.

The god fell to the floor. But in that same instant Craigenside thrust his body forward spasmodically in an effort to save the idol from destruction. He overbalanced, and his head brought up with a jarring impact a foot or so below the pendulum. The enormous coffin, which must have been poised very nicely on the warped flooring, suddenly hung out over him, became a descending shadow, then with a horrid crash shut the master of Craigenside from view with his neck broken.



The prophecy of old Jared was so far fulfilled, that the coffin he had built, as if that vindictive spirit had informed it, claimed its own. Jim Garnett stood holding the body of the unconscious girl across his arm; and the head of the little god, snapped off short, spun to the feet of the priest, its eyes still emitting that baleful light with its suggestion of green fire.

Mr. James Smith snatched it up and vanished through the open doorway.

ACAROONS

(Concluded from Page 17)

"I believe I do," Pepita replied; and reaching over his shoulder she slipped her hand inside the crack and opened the safety catch.

The door swung open and Billy found himself kneeling on the doorstep, face to face with the runaway girl.

"Yes; I thought so," said Pepita. "Mr. Manners, permit me to present my little sister Suzan."

"Your little sister!" exclaimed Billy. "Your little sister S-Suzan! Why, that's perfectly fine, isn't it?"

Pepita ignored him. She turned to her sister.

"Don't you think you'd better get up off the floor?" she remarked. "And then perhaps you'll tell me what you've been doing."

Suzan did not budge.

"Don't be angry with her," said Billy. "It's all my fault. She couldn't go to the dance, you know, because she tickled her brother's feet at prayers yesterday; and she just went to peep through the windows. And I saw her there, and we've—we've just been talking."

"Mr. Manners, what are you trying to tell me?" asked Pepita. "We have no brother. I thought Suzan was at the dance. By the way, haven't you been cutting a good many this evening?"

"You have no brother!" exclaimed Billy. "Why, she told me ——"

"Goodness knows what she told you!" said Pepita. "She's a perfect little terror! You didn't like me, Mr. Manners, because you thought I posed; but you let her make a monkey of you!"

"Then—then it's not true!" Billy stammered. "You were just stringing me—you didn't really care ——"

"Mr. Manners, do get up," begged Pepita, "and let me close the front door. There'll be some people here for supper at any minute."

Billy stood up, but he did not let go of the little hand. He stared very hard at Suzan; and as he did so he was thinking very rapidly.

"Oh, shut up, sis!" said the little voice. "You don't have to give the whole show away just because you're jealous. I was just having a little fun." Did she falter just the least bit over the word? Billy was not sure, but he held onto the hand all the tighter. "Mr. Manners," she went on, "I expect you won't want to see me again. Please go away now." She looked at him rather mournfully; and then suddenly she began to laugh. "Have a macaroon before you go?" And she produced a large plate of them from behind her back.

Pepita was growing impatient. All this fuss over that child!

"Hadn't you better call it off, both of you?" she said. "Suzan ought to be spanked; and you —— Oh, mercy! Here are the others!"

Sounds of feet on the porch, and laughter, and the door opened to admit a crowd of supper guests from the dance.

They greeted him with loud outcries: "Why, if there isn't Mr. Manners!"—"Do you know you cut my dance?"—"Rehearsing something?" This last from Buck.

Billy arched his eyebrows. Then he looked at Suzan, and in her downcast eyes he seemed to find what he wanted. He was still holding her hand in both of his, while with her free one she extended the plate of macaroons to the entering company.

Billy turned and faced them.

"I'm terribly s-sorry!" he said. "I'll apologize to you all later. You see, the fact is I've been awfully busy. Miss Suzan Farragut has done me the honor to consent to be my wife!" And before them all he drew her to him and kissed her.

Doubled, tripled, quadrupled outcries! How perfectly romantic! But why in the name of sense had he chosen Suzan when he might have had Pepita?

What on earth was he doing? thought Pepita herself; and she forgot to pose at all for perhaps the first time in her life.

"Oh, Mr. Manners!" whispered a small voice in his ear—a voice with a tremble of laughter in it. "What a whopping fib!"

"One good fib deserves another!" he laughed back at her. "Do I have to go now—if I take a macaroon?"

"No; I expect you'll stay now," she replied. "Take a lot!"

They always have a big bowl of macaroons on the sideboard in Billy's home now.

The Bouquet of the Bath

CLEAN, clean, clean—that is the perfume of Cashmere Bouquet Soap. The inviting fragrance breathes of refinement and critical perception of the niceties of life. The luxuriant lather comes freely, softly and quickly—refreshes as it cleans.

This is the characteristic of Cashmere Bouquet which has made it the standard among toilet soaps for three generations. Your dealer has the large size—and the new size at 10¢ a cake.

FOG

(Continued from Page 13)

Mechanically, half in a daze, Billy wheeled Ninespot to the extreme outside of the track, into the position indicated by his number. Tears of helpless rage stood in his eyes; a lump in his throat threatened to choke him. His need was so great, his chance at best so pitifully small; and now he knew that even this slender thing was to be taken from him—Ace of Spades was "trying." Barring a miracle, Ace of Spades would win.

It seemed that some of the other horses were also out to win, or at least to steal an advantage in the break; and Mr. Francis X. Sheehan, Official Starter, took hold of the railing of his perch and used all the language permissible on such occasions, and some which is supposed to be under the ban.

Four times he saw the shifting, plunging line shaping itself for a fair start, and each time some eager jockey attempted to anticipate the rise of the barrier by a wild sudden dash—after which there were many wild dashes furnished by the exasperated Mr. Sheehan. In each case the culprit, perceiving his error, managed to duck under the narrow strip of elastic webbing without breaking it—something to be thankful for, though one would never have guessed this by listening to Sheehan's blistering comments.

From his position on the outer rail Billy Randolph was also keeping his eye on the field. What faint hope remained in him was centered on a good start—a good one for Ninespot; a bad one for Ace of Spades.

A fifth time the field wavered into something resembling a line, and Sheehan bent forward. At least seven of the riders interpreted that crouching attitude as a preliminary to jerking the trigger and releasing the barrier; they hurled their mounts forward—snap! went the strip of webbing, and seven horses dashed down the back stretch and disappeared in the fog.

"No! No!" barked Sheehan with profane emphasis. "No, I said! Bring them beagles back here, till I fine every mother's son o' ye! Bring 'em back!"

And, with these words still on his lips, Mr. Sheehan was given something else to think about. One of the horses still at the post adroitly planted both heels in the midriff of the assistant starter, a gentleman whose name was Connolly.

"Are ye hur-rted, Con?" asked Sheehan anxiously.

"Course not!" gasped Connolly. "I'm layin' here—on th' ground—for fun! Gimme a hand; I'm near—bruk in two!"

Mr. Sheehan clambered down from his perch, grunting, for there was much of him and nearly all of it in one place; and, because Connolly was too sick to do anything but use his whip on the horse that had kicked him, Sheehan had to help with the mending of the barrier. He was still at this ticklish job when the fugitives began to return from their brief dash down the back stretch—and so busy that he forgot to fine the riders; forgot something else, too, as we shall see.

Now when the false break occurred the horse that led the way into the fog bank was Ninespot. When the other horses checked their speed Ninespot drifted by them, no more than a shadow on the upper rail. Billy heard the yell of the starter and sawed at the reins; Ninespot had the bit in his teeth and refused to slacken his stride. The heavy-headed chestnut was out in front alone; it suited him to run in that position and he had no desire for company and competition. He fought viciously for his head, and it was only after a struggle that Billy succeeded in bringing the big brute to a standstill. The half-mile post loomed close ahead, tall and white in the fog; Ninespot seemed to be regarding it with deep interest. He showed not the slightest inclination to retrace his steps.

"You hammer-headed fool!" said Billy. "Come on; we're goin' back!"

Ninespot thought otherwise; he shook his head, grunted, and refused to budge. Billy touched him lightly with the whip; Ninespot laid his ears back and kicked his heels in the air. Billy coaxed; Ninespot sulked. Billy threatened; Ninespot pointed his ears at the half-mile post and shrugged his shoulders. At last mind triumphed over matter, and conqueror and conquered started back through the fog—but very slowly. Ninespot had decided to obey, but he would take his own time about it.

"It's a wonder Sheehan hasn't sent Connolly after me," thought Billy; and then, out of the dripping wall, faint and far away, a hoarse rumbling sound reached his ears:

"No! No! You can't break that way, I tell you! Walk 'em up slow! Slow!"

Billy fairly bounced in the saddle; Ninespot stopped and pricked up his ears.

"Great King!" whispered the boy. "He hasn't missed us; Sheehan hasn't missed us! He's linin' 'em up for another start!"

Plainly, here was a situation requiring thought—an astounding condition of affairs demanding analysis and action of some sort. Billy Randolph was thoroughly familiar with the ironclad racing rule, which—for good or ill—centers all responsibility upon a single individual. As soon as the horses pass the paddock gate and appear upon the track they are declared to be "in the hands of the starter"; and they remain in his hands until the barrier rises. During that period no accident to a horse, no error of judgment on the part of any human being can affect the bets as placed. They must stand for decision at the wire. The starter may leave an odds-on favorite flat-footed at the post or send away a long shot ten lengths ahead of the field; but from his action there is no appeal. While the horses are in his hands the Official Starter is rather more than an autocrat—he is the personification of turf law.

Sheehan had blundered in allowing a horse to slip through his fingers; and the blunder amounted to an advantage of at least a quarter of a mile in a seven-eighths race—a flying start for Arizona. As Billy peered into the fog wall one thought struck him with considerable force—he might steal the race, but no witnesses could rise against him.

Nobody could see him there in the fog; he was alone with his conscience and a very bad horse.

"If you stay with it, Billy, run your hosses on the square."

Yes, his father had said that; but his father had also told him to think of his sister first.

"Huh!" said Billy aloud. "We ain't goin' to stay with it, are we, Ninespot? We're goin' to Arizona ——"

And then he heard the pflung-ng-ng of the barrier and the roar of the Official Starter:

"You're off! Take 'em away!"

Billy whirled Ninespot in his tracks and gave him his head.

"Let's be movin' or we'll get run over," said he.

The big chestnut seemed to sense the humor of the situation. He set a brisk pace, but Billy curbed him to half speed.

"Not quite so fast, ole boy. If we get down there too soon they might ask us where we've been. . . . Steady; that's it—steady!"

Ninespot loafed round the upper turn into the home stretch; and it was then that Billy began to watch the track behind him. As the chestnut passed the paddock gate a black shape appeared on the rail, ten lengths to the rear.

"Now you can run if you want to!" said Billy, drawing his whip. "You got a lot of speed left in you. Let's have it!"

When the grand stand loomed up, a giant shadow in the fog, Billy thoughtfully guided Ninespot well into the middle of the track.

"We'll not take any chances with them judges," said he. "They may not be expectin' us to come first; so we'll get over where they can't overlook us. . . . Oh, no hurry; no hurry—he's pumped out; an' here's one time when a Ninespot takes an Ace!"

Five lengths behind the easy-going chestnut came a laboring black horse, then a long gap, and finally the straggling field.

"That one, eh?" said the presiding judge, fingering his beard. "Well, I'm mighty glad of it. I used to know Tom Randolph. Fine old character! Straight as a die! Boy's just like him."

"Ye-es," said the associate judge; "but this chestnut horse won, pulled up, 'way ahead of Ace of Spades. I wish you'd tell me ——"

"Bad horses, my boy; bad horses," said the presiding judge. "Nobody knows what's going to happen in a dog race like this!"

As Ninespot slowed to a canter the black horse drew alongside.

id you steal 'em?"

"No steal 'um!" cackled Lee Sing. "Buy 'um! Nisha mawnin' me ketch 'um twen'y cent ni'spot—alla sem ni'spot two times ——"

"He made a killing in the lottery—hit nine of the winnin' numbers," interrupted George the Greek for Jennie's benefit. "A twenty-cent nine! No wonder he bought new clothes; I would, too!"

Lee Sing giggled happily and rocked back and forth on his curved white soles; pidgin English flowed from him in a steady stream:

"Ketch 'um losh money; buy 'um clothes—'nen I 'memba you tell 'um me hoss he win—Ni'spot he win—come out by laish tlack—pay 'um dolla, go insi'—bet 'um; bet 'um evlybody Ni'spot he win ——"

"Holy Moses!" breathed George the Greek. "And so that's why we didn't get a price! This crazy Chink played him down! Why, I'll bet he won a million dollars!"

"Wait a minute," said Billy, interrupting Lee Sing, who was still babbling cheerfully. "What was Ninespot's price—how much to one?"

"No sabby plice," said Lee Sing, shaking his head. "Bet 'um evlybody—no sabby how much—you look see!"

He walked over to the table and began producing bundles of currency and fistfuls of gold. His black silk trousers proved to be a veritable Golconda; the inside of his plum-colored coat yielded rich treasure. The three witnesses could only stare at the loot; they were dumb before such a flood of dollars.

Lee Sing dropped the last bundle of yellow-backed bills and stepped back with a tipsy flourish.

"So now me come you' place," said he to Billy. "You alla sem my podnah; ketch 'um hop!"

"There ain't any hop here!" said Billy sternly. "What does he think this is—an opium joint?"

"Not hop—half!" squealed George the Greek excitedly. "Don't you see? He says you're his partner an' he wants you to have half!"

"Aw, go on!" said Billy. "You're crazy!"

"Ask him!" cried George. "You slipped him a good thing an' he's declared you in with the bet—a Chink'll do it every time. Ask him!"

Billy looked at Lee Sing, who was beaming like a yellow moon.

"You—you want me to have any of that?" said the boy, pointing to the table.

Lee Sing bobbed his head rapidly.

"Me podnah—you podnah, alla sem. Me ketch 'um hop—you ketch 'um hop."

"Well, can you beat that?" gasped Billy Randolph. "He's got every instinct of a Christian!"

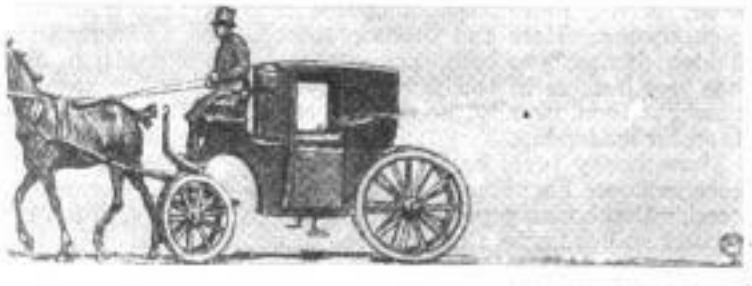
Lee Sing laughed as he began to stack the gold-pieces.

"One time me Clistian—go Mission thlee time evly week; jusha now me not Clistian—me Chinaman!"

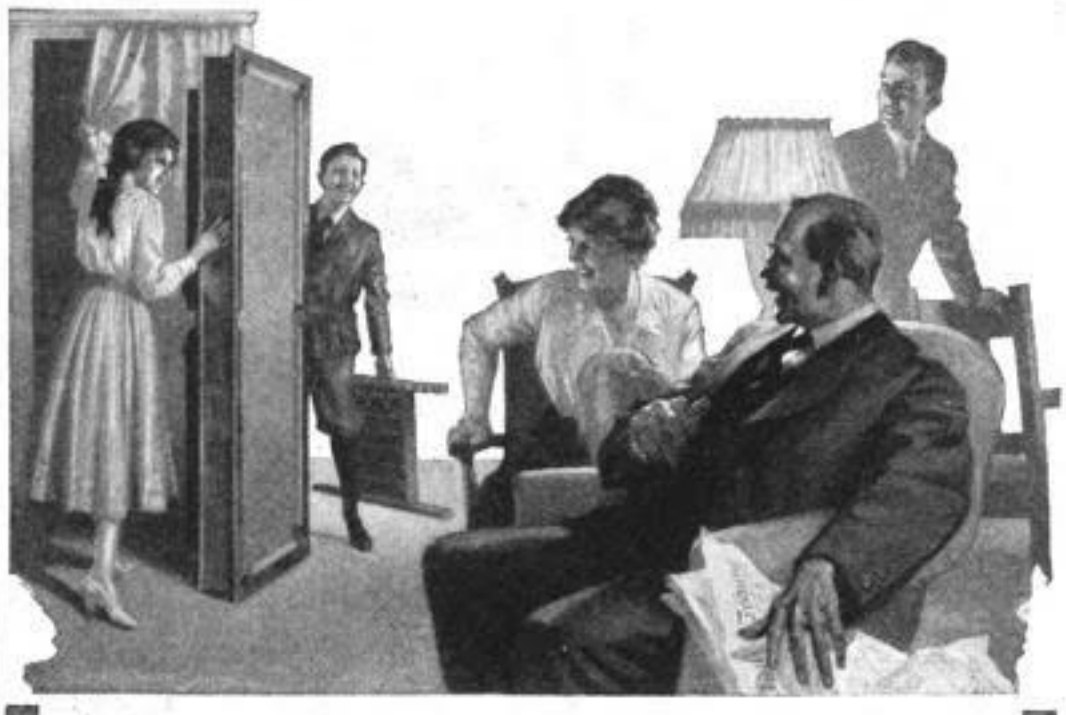
Billy Randolph and his sister stood in the doorway and watched their amazing visitor disappear in the fog.

They had not been able to detain him long. He had pressing engagements in Fish Alley.

"Pinch me, Jen, and see if I'm awake!" said Billy.



George the Greek needed no such demonstration. He was counting the money into neat piles. Out of the fog wall came a quavering Celestial falsetto, wandering aimlessly from key to key, growing fainter with increasing distance:



"In uh swee-ee-eet . . . by um by . . .
We sha' lest on 'at beau-tee-fu' shaw,
Beau-tee-fu' shaw."

"Well," said Billy, "it'll be comin' to him, at that!"

"Come in out of that confounded fog!" called George the Greek. "What's the matter with you two lunatics anyway?"

"Don't call the fog any hard names," said Billy gently. "It done the Randolph Stable a mighty good turn to-day."

Someone Says, "*Billiards!*"

And Out Comes The Brunswick Table

Folded up in a closet or in any spare space, the "Quick Demountable" Brunswick Home Table is triumphantly brought forth by eager hands and set up in the center of the room. It is only the work of a minute to push back the chairs, rack the balls and fire the shot that starts an evening of royal sport for young and old.

Carom and Pocket Billiards never tire—their charm is endless. Sparkling hours of merry rivalry with those you love—moments of tense uncertainty!

To live a healthy, worry-proof life, to entertain friends and to keep boys home—install a scientific Brunswick Home Billiard Table.

BRUNSWICK

country store. He attended public school, and at eighteen went to work as a clerk in a country-town bank. Two years later he went down to the city, where he took a clerkship in a minor bank. At twenty-nine he was made assistant cashier, and six years later was elected to the cashiership of another minor bank. At thirty-nine he was made president. Then there was a bank merger, and he was made president of the consolidated institution.

All his life after public-school days has been passed in banks; so when he won his first important banking position he doubtless knew the technical side of banking thoroughly.

On the other hand, there is Alvin W. Krech, president of the Equitable Trust Company. He was born at Hannibal, Missouri, where his father—who came to this country, like so many other liberal Germans, after the failure of the revolutionary movement there in 1848—was a teacher. He went to public school and began his business career as a clerk in a flour mill at Minneapolis. Round thirty he became a partner in the mill and eventually owner of it. He then turned to railroad construction, and so to railroad enterprise generally. When the Union Pacific Railroad was reorganized, Mr. Krech was appointed secretary of the reorganization committee. That brought him to New York, and in due time he engaged in banking. But he was a successful, influential man of middle age before he engaged in banking.

The Successful Type

Boys are taught a good deal of poppycock about the vital necessity of technical training. For an underling technical ability counts perhaps for ninety in a scale of a hundred; but for an overling it probably does not count for ten out of the hundred. This is particularly true of banking, which is a kind of composite of all businesses.

No doubt every big bank contains men who know the technical mechanism of the business much better than the president does. The late J. P. Morgan was commonly accounted America's foremost banker; but several times, when under cross-examination, he had to confess that he knew precious little about the details of his own business. As to various other businesses, in the transportation, manufacturing and trading lines, where he exerted a very great influence, his technical knowledge of their details would not have won him a junior clerkship in them. A candid bank president has confessed that, in selecting a vice president for his concern, he cares little whether the man knows anything in particular about banking.

Business ability in its higher manifestations is pretty much all out of the same piece of cloth. If a man has business ability in the abstract he will make a good banker. If a young man is ambitious to reach the first table many other things are much more important than technical knowledge. Those at the first table can always find plenty of people lower down who will know how to manage details. It may even be doubted whether careful preoccupation with details is a good augury of one's ever reaching the first table. That perhaps indicates another type of mind—the studious, cautious, particularizing, indwelling type; whereas the most successful type is apt to be expansive, adventurous, confident, generalizing.

Probably a college career is an advantage—not at all on account of its formal training and for the stuff in the textbooks and classrooms. So far as notable success in business goes—as distinguished from professional success—that stuff might just as well be anything else. But probably college tends to promote sociability, to strengthen one's facility in getting acquainted and making friends. That facility usually counts for a great deal in business success. The man who can meet people easily, cordially, agreeably, has an advantage. College may help him to that.

Of the twelve Morgan partners, you remember, eight are college men and four are not. But the heads of the house for two generations have been college men, and perhaps it leans somewhat more in that direction than high finance generally does; or perhaps the preponderance of college men on the Morgan roster is merely an accident.

Of the twelve big-bank presidents only two could be called college men; and only one of them, I believe, is a graduate of an institution of higher learning. In the case of the big-bank presidents there were more people to do the choosing than in the case of the Morgan partners; so this list is rather more representative of the way high finance does its choosing. On the basis of this list college education is evidently of slight importance.

Taking the twenty-four men—Morgan partners and big-bank presidents—only five were born outside that comparatively small territory which lies along the North Atlantic Seaboard. Nineteen were born in New England, New York and Pennsylvania. Of course this does not indicate that those states are more prolific in financial genius; but the ambitious young man in those states is very apt to go to New York, and so to get himself into the orbit of high finance. If these men had happened to be born in the Mississippi Valley, most of them would no doubt now be cutting a figure in business in Kansas City, Minneapolis, and so on, instead of on the larger stage.

Of the twenty-four names on the list only one was of any particular significance in business before its present bearer made it so. The exception, of course, is J. P. Morgan. He inherited a great opportunity. What is even rarer than that, he proved equal to it; for the house doubtless does more business to-day than ever in his father's time, and, on the whole, probably has quite as great influence.

A Morgan came to this new country from Wales early in the seventeenth century and settled on the soil in Connecticut. For several generations his successors were undistinguished New England farmers. Soon after the Revolutionary War a James Morgan broke away from the farm and set up in business as keeper of a tavern on the post road at Hartford. Stagecoaches, of course, were the chief means of transportation in those days, and James Morgan gradually got control of a number of stage lines—dimly foreshadowing his celebrated grandson's operations in a more extensive means of transportation.

Then a big fire happened in New York—big, that is, for a place which we should now consider only a flourishing country town. For some inscrutable reason, Hartford has always been a home of fire insurance. One of the Hartford insurance companies was hard hit by this New York calamity. For a time its solvency seems to have been questioned. Evidently James Morgan thought it was sound, for he bought up, at a heavy discount, many claims against it. When the company finally paid out he had a very comfortable fortune.

Another Able Morgan

His son, Junius Spencer Morgan, inherited not only the fortune but the ability that had won it. He went into the dry-goods trade, with Levi P. Morton as a partner. The dry-goods trade at that time was one of the chief importing businesses; so it involved foreign connections and dealings in foreign exchange. Kuhn, Loeb & Company got into the international banking business by way of the dry-goods trade. Morgan set up a house in London, then in Paris, and long before his death left the dry-goods business to devote himself to banking.

He was—nominally, at least—head of the Morgan house up to his death in 1890; though by that time his son, the first John Pierpont, was very active in its affairs. It is an odd coincidence that J. S. Morgan died abroad—at Monte Carlo—while his son died at Rome. He left a fortune of ten million dollars and a great business. How the first J. P. made it a much greater business is well known. They are saying now that, judging by his performance to date, the present J. P. will keep it at the height his father attained.

But only once in a long while does a family develop four exceptionally able men in succession. Here and there in the roll of high finance you come across a name that was famous in the previous generation; but then, usually the name does not stand for leadership.

Mere money involves little in the way of leadership. There may be a popular impression that a man gets a big job in finance because he has made a lot of money; but

comes first and the man makes a lot of money because he has a big job. A House of Morgan, or a big bank, does not take a man into its fold because it wants his capital. It can get all the capital it needs in an easier way. It takes in the man because it wants his personality; because it thinks his personal qualities of ability, energy, attractiveness, and so on, will strengthen its influence.

A great part of business is just dealing with men; essentially it is just salesmanship in some form or other. All business is making something and selling it, and there is a heavy emphasis on the selling end. The job of the president of the City Bank is finally to see that the bank is made right, and then to sell it, pretty much essentially as a grocer sells his soap and flour. By and large, the more people he knows and the more people like him, the better salesman he will be.

The Men Who are Chosen

This is why a good many Government officials—Secretaries of the Treasury and Comptrollers of the Currency—are given high positions in big banks; not because of their knowledge of banking and finance, but because they have been well advertised. Their names are well known; they have formed many acquaintances; and so they will presumably be good salesmen. Mr. Vanderlip came from the Treasury Department. Mr. Hepburn, chairman of the board of the Chase National, was Comptroller of the Currency. Mr. Gage and Mr. Shaw, upon leaving the Treasury, were made presidents of New York banks. The other day Senator Burton, of Ohio, was elected president of a New York bank.

At one time three ex-Comptrollers of the Currency were presidents of important banks at Chicago. The theory was that, being well known, they were in a position to sell the bank efficiently. George B. Cortelyou, private secretary to President McKinley and President Roosevelt, then Secretary of Commerce and Labor and Secretary of the Treasury, was taken from the latter position and made president of the opulent concern that supplies New York City with gas.

If you should look over the men who hold big jobs in high finance you would find them a well-set-up lot physically, running decidedly to the broad-shouldered, deep-chested type, with a round neck that fills out its collar snugly, and a development at the back and base of the skull which indicates large vital motor power.

The candidate for an important job in high finance ought to be physically vigorous. He ought to have a lot of friends and be of the sort that makes friends readily. He had much better be a shade under forty than two shades over. He must have a good deal of confidence in himself and be sufficiently egotistic to assert himself without being offensive about it.

Of course he must have a considerable degree of sheer intellectual ability—that is, he must be able to think fast and straight, and to size up the important elements in a situation. The extent of his bank account and his technical training are immaterial, except that, as a matter of course, he must have had a good deal of practical experience of some sort, and have shown that he can deal successfully with practical affairs—which really means dealing successfully with men.

Then, if the candidate is going to get elected, he must come into contact with a man, or with men, who have the disposal of important financial jobs; and that is probably about nine parts sheer luck. No doubt, for every man who lands a big job in Wall Street there are a hundred men who have all the natural qualifications; but they did not happen to fall into the right orbit.

It seems probable, however, that the orbit is growing wider. Of the two latest Morgan partners, one was brought up in Minnesota, the other in Missouri. When Mr. Cochran left the Liberty Bank a new vice president was taken in; and his new vice president got his business experience mainly in Detroit.

The roster changes continually, both because men die or retire and because the business of the big institutions continually expands. Very rarely does a "son's" name get on it. It is a free field for talent—and luck.

Is Your Battery Holding Its Own?

YOUR car battles its way today through the grip of Winter's worst storm. A few short months and the blazing heat of Summer's sun brings new conditions. Roads, speeds, traffic and many other causes are constantly tearing down or building up the storage battery of your car.

Whether your battery endures the conditions unfailingly, depends not only on the kind of battery, but also on the service behind it.

If your battery is "supervised by Prest-O-Lite Service" you may avoid the greater part of battery trouble—without this supervision your battery may be seriously handicapped. Any battery, no matter how good, may easily be ruined by neglect.

No matter what conditions you encounter—no matter where you may be—you'll find Prest-O-Lite Service waiting to keep your battery in good condition and insure your satisfaction.

There are special Prest-O-Lite Service Stations in cities and towns in all parts of this country—backed up by the great chain of Prest-O-Lite Factory branches in principal cities—insuring prompt, direct *factory* service.

When you need a new battery, remember—there is a Prest-O-Lite battery of correct size for your car, and it will give you superior service and satisfaction.

CONGOLEUM RUGS

FREE!
Handsome Rug Chart
We will send you free an attractive Rug Chart printed in colors. It will give you some idea of the beauty of Congoleum Rugs. Just send us your name and address. It will help solve that floor covering problem.

Beautiful—Convenient—Sanitary—Economical

floor coverings possess one or two very desirable features. Carpets oft and warm, but they are expensive, hard to clean, and they r evenly. Good fabric rugs are artistic, but they gather dust, are ked up, and their price makes them a luxury.

n Rugs are rapidly supplanting low-priced carpets and fabric use in addition to great beauty they combine convenience, and economy. They have a firm, washable surface, with just like the finest of woven rugs.

For Every Room

variety of artistic designs and ors will enable you to find a Rug that will harmonize with tive scheme.

ngoleum Art-Rugs

ave Congoleum Art-Rugs—a nsation in rugs. They are the f famous rug designers and ually beautiful patterns. Dis- ecause of their beautifully ich colors.

Sizes and Prices

n Art-Rugs are seamless. They any beautiful patterns and in as follows:

feet, $10.00 9 feet x 12 feet, $11.00

goleum Utility-Rugs

s are made in a greater variety d patterns than our Art-Rugs. our original Congoleum Rug heir prices are surprisingly low.

Utility-Rug Sizes and Prices

3 feet x 4½ feet $0.98	6 feet x 6 feet $2.60
3 feet x 6 feet 1.30	6 feet x 9 feet 3.90
4½ feet x 4½ feet 1.50	Two-piece Rug 9 feet x 12 feet $8.00

Washable and Sanitary

All Congoleum Rugs are entirely waterproof—therefore washable and sanitary. A damp mop keeps them clean. No dusty beating or sweeping.

Lie Flat Without Fastening

Congoleum Rugs never curl or "kick up." No need of tacking or pasting down. They "hug the floor." No dust can collect under them.

Congoleum By-The-Yard

If you want to cover a whole floor, you will find Congoleum By-The-Yard a real bargain. Guaranteed to outwear printed linoleum under equal wearing conditions. Sanitary and rot-proof. No fastening needed. Many pretty patterns to select from. Made in 72-inch width. Price 50c. per square yard.

Congoleum Rug Borders

These unique floor coverings are literally hardwood floors in rolls. To be used around a center rug. They give all the artistic effects of real oak floors at a fraction of the expense. Not a cheap, painted imitation. They lie flat without fastening, are waterproof and sanitary.

Made in 36- and 24-inch widths, at 50c. and 40c. a yard respectively. Your dealer will cut any length desired.

Protected By Patents

Congoleum Rugs are manufactured in accordance with United States and foreign patents, with numerous other patents pending both in the United States and foreign countries.

Be sure to send for handsome Color Chart.
